Ocean Circulation Theory:

Ocean Circulation Theory Joseph Pedlosky, 1996 An overview of the advances made in the last decade and a half in this field Based on an advanced graduate level course the book represents fundamental insights into the structure of the physical theory of the large scale dynamics of the oceans The author has maintained throughout a blend of analytical and numerical results so as to achieve as deep a physical understanding of the dynamics of the large scale circulations as possible The results of the theories are compared with observations and the success or inadequacies of the theories are highlighted Topics of particular interest are theory of the wind driven circulation the thermocline the equatorial circulation and the abyssal circulation Much of the material previously scattered throughout the literature has been collated here for the first time

Ocean Circulation Theory Joseph Pedlosky, 2013-03-09 The waters of the earth are gathered in shallow irregular interconnecting basins Heated by the sun and driven by the wind the oceans circulate endlessly The general circulation of the ocean is the persistent pattern of this flow on the scale of the basins It is the heart and soul of physical oceanography and the explanation and prediction of the flow from the principles of fluid dynamics is the chief goal of the physical oceanographer Along with the pattern of the motion the associated fields of pressure temperature salinity and density are also necessary components of a complete theory for the ocean circulation since they are dynamically linked to the motion of the oceans The physical problem posed by the general circulation of the oceans is a difficult one both experimentally and theoretically From the point of view of theoretical fluid mechanics the difficulty springs fundamentally from the recirculating character of the circulation The fluid is gathered into a single though highly contorted basin

Large-Scale Ocean Circulation R. M. Samelson, 2011-06-27 Mounting evidence that human activities are substantially modifying the Earth's climate brings a new imperative to the study of the ocean's large scale circulation This textbook provides a concise but comprehensive introduction to the theory of large scale ocean circulation as it is currently understood and established Students and instructors will benefit from the carefully chosen chapter by chapter exercises This advanced textbook is invaluable for graduate students and researchers in the fields of oceanic atmospheric and climate sciences and other geophysical scientists as well as physicists and mathematicians with a quantitative interest in the planetary fluid environment

Ocean Dynamics Dirk Olbers, Jürgen Willebrand, Carsten Eden, 2016-08-23 Ocean Dynamics is a concise introduction to the fundamentals of fluid mechanics non equilibrium thermodynamics and the common approximations for geophysical fluid dynamics presenting a comprehensive approach to large scale ocean circulation theory The book is written on the physical and mathematical level of graduate students in theoretical courses of physical oceanography meteorology and environmental physics An extensive bibliography and index extensive side notes and recommendations for further reading

and a comparison with the specific atmospheric physics where applicable makes this volume also a useful reading for researchers Each of the four parts of the book fundamental laws common approximations ocean waves oceanic turbulence and eddies and selected aspects of ocean dynamics starts with elementary considerations blending then classical topics with more advanced developments of fluid mechanics and theoretical oceanography The last part covers the theory of the global wind driven circulation in homogeneous and stratified regimes the circulation and overturning in the Southern Ocean and the global meridional overturning and thermohaline driven circulation Emphasis is placed on simple physical models rather than access to extensive numerical results enabling students to understand and reproduce the complex theory mostly by analytical means All equations and models are derived in detail and illustrated by numerous figures The appendix provides short excursions into the mathematical background such as vector analysis statistics and differential equations

Ocean Circulation Rui Xin Huang, 2010 The interaction between ocean circulation and climate change has been an active research frontier in Earth sciences in recent years Ocean circulation and its related geophysical fluid dynamical principles are now taught at graduate level in many Earth and atmospheric science departments This is the first advanced textbook to discuss both wind driven and thermohaline driven processes two important aspects of large scale ocean circulation It provides a concise introduction to the dynamics and thermodynamics of oceanic general circulation This includes sea water thermodynamics and the energetics of the ocean circulation an exhaustive theory of wind driven circulation thermohaline circulation with discussions on water mass formation erosion deep circulation and the hydrological cycle and interactions between wind driven and thermohaline circulation Highly illustrated to help the reader establish a clear mental picture of the physical principles involved the book is invaluable for advanced courses in ocean circulation and as a reference for oceanographers and Earth scientists

Wind-driven Ocean Circulation Allan R. Robinson, 1963 *Quasi-Geostrophic Theory of Oceans and Atmosphere* Fabio Cavallini, Fulvio Crisciani, 2012-08-11 Large scale winds and currents tend to balance Coriolis and pressure gradient forces The time evolution of these winds and currents is the subject of the quasi geostrophic theory Chapter 1 presents concepts and equations of classical inertial fluid mechanics Chapter 2 deals with the equations of thermodynamics that close the governing equations of the fluids Then the motion is reformulated in a uniformly rotating reference frame Chapter 3 deals with the shallow water model and the homogeneous model of wind driven circulation The chapter also describes a classical application of the Ekman layer to the atmosphere Chapter 4 considers the two layer model as an introduction to baroclinic flows together with the concept of available potential energy Chapter 5 takes into account continuously stratified flows in the ocean and in the atmosphere

Modelling Oceanic Climate Interactions Jürgen Willebrand, David L.T. Anderson, 2013-06-29 The ocean plays a central role in determining the climate of the earth The oceanic circulation largely controls the temporal evolution of climate changes resulting from human activities such as the increase of greenhouse gases in the atmosphere and also affects the magnitude and regional distribution of those changes On interannual and longer time scales the ocean is through its interaction with the atmosphere a source of important natural climate variations which we are only now beginning to recognise but whose cause has yet to be properly determined Chemical and biological processes in the ocean are linked to climate change particularly through interaction with the global carbon cycle A quantitative understanding of the oceanic role in the climate system requires models which include many complex processes and interactions and which are systematically verified with observations This is the objective of global research programs such as TOGA WOCE and JGOFS Coupled numerical models of the oceanic and atmospheric circulation constitute the basis of every climate simulation Increasingly it is

recognized that in addition a biological chemical component is necessary to capture the pathways of carbon and other trace gases. The development of such coupled models is a challenging task which needs scientists who must be cognizant of several other disciplines beyond their own specialty. Large-Scale Transport Processes in Oceans and Atmosphere J. Willebrand, D.L.T. Anderson, 2012-12-06. One of the major experiments in earth science at the present time is about to begin the World Climate Research Program WCRP. The objectives of WCRP are to determine the extent to which climate change can be predicted and the extent to which human activities such as increasing the level of CO₂ can influence our climate. 2 To understand and possibly to predict climate change one needs a good understanding of the dynamics of the ocean, the atmosphere and the processes by which they are coupled. Two major programs are being developed within WCRP: TOGA (Tropical Oceans Global Atmosphere) and WOCE (World Ocean Circulation Experiment). The success of these programs will depend on many things, not least of which is the existence of a pool of active young researchers. This NATO Advanced Study Institute brought together students and young scientists from 13 countries, most of them from Europe and North America. The objective was to provide them with a background in the perceived state of knowledge of atmosphere and ocean dynamics and to mediate a flavour of the problems presently concerning scientists active in climate-related dynamics. In the past, the two disciplines of oceanography and meteorology have largely been carried out separately. But for climate research, both disciplines must interact strongly, and another objective of this school was to bring together both oceanographers and meteorologists. To promote an integrated approach, the lecture presentations were divided into two formats.
