Pseudomonas Infection and Alginates Peter Gacesa, Nicholas J. Russell, 2012-12-06 The concept of this book arose out of an international workshop which we organized and held at the University of Wales Conference Centre at Gregynog The workshop was the first occasion on which researchers from all the different disciplines concerned with the extracellular virulence factors of mucoid strains of *Pseudomonas aeruginosa* in relation to cystic fibrosis CF had met to discuss this multifaceted problem It was deemed a particularly timely moment to gather together experts for the exchange of facts ideas and hypotheses No formal abstracts were presented and no proceedings were published But during the succeeding months the organizers were persuaded by a number of participants that a wider audience should benefit from what had proved to be such a fruitful cross fertilization of expertise Thus we moved from being workshop organizers to book editors sure in the knowledge that at least we had a willing and enthusiastic set of contributors It should be stressed however that this book is not a transcript of that workshop Not all those participants are authors and some new names have been added Instead we have focused on alginate as an extracellular virulence factor of *P. aeruginosa* in CF pulmonary infections Recent advances in the biochemistry and molecular genetics of alginate biosynthesis as well as in our understanding of the basic defect in CF and isolation of the gene mean that the book is even more timely than when first planned Cumulated Index Medicus

Cystic Fibrosis Pulmonary Infections: Lessons from Around the World Adolf Bauernfeind, Melvin I. Marks, Brigitta Strandvik, 2012-12-06 Infection of the lower respiratory tract is a major determinant of the course of cystic fibrosis Although numerous efforts have been made to elucidate the specific mechanisms predisposing the respiratory mucosa of cystic fibrosis patients to infection so far no clinically relevant procedures for completely effective prevention or control of infection have resulted Hence in dealing with infections in cystic fibrosis we continue to rely mainly on antimicrobials Antiinfective measures are inseparably correlated with microbiology and the quality of antiinfective

therapy directly reflects the quality of microbial monitoring. Validated guidelines for microbiologic testing and anti-infective use need to be developed and made available to all health providers and their cystic fibrosis patients. Several years ago the editors cochaired a symposium at the International Congress of Chemotherapy on the Global Perspectives of Microbiological and Clinical Infectious Diseases in Patients with Cystic Fibrosis. During this half-day symposium the editors heard reports from several countries around the world with an alarming range of survival for patients with cystic fibrosis. This sent a dramatic message to us that the understanding of this disease, its diagnosis, management, and prevention was different in various countries and that patients may be inconsistently served. That is how our journey began.

Handbook of Animal Models of Infection Merle A. Sande, 1999-05-28. Handbook of Animal Models of Infection is a complete revision of a three-volume text that was published in 1986. It incorporates the major advances in the field during the past decade, in particular those concerning molecular biological procedures and new models that have been developed. It focuses on both methods and techniques, which makes it an essential and comprehensive reference as well as a benchtop manual. The Handbook will help investigators save time and effort in formulating an approach to test a new potential therapeutic agent or combination of agents for in vivo efficacy and to position the therapy for specific infections where it may have therapeutic promise. The book is divided into five sections: the first covering the general methodologies followed by sections describing experimental bacterial, mycotic, parasitic, and viral infections. Discusses ethical and safety aspects in an introductory background section. Covers principles of animal care and current techniques appropriate for the use of animal models of infection. Details a wide range of animals including rodents, rabbits, cats, and primates. Provides hands-on descriptions of how to set up the model. Discusses the major advantages and limitations of each model. Ensures full coverage of bacterial, fungal, viral, and parasitic infections.
