Human Activities and the Tropical Rainforest Bernard K.

Maloney,2013-11-11 Arising initially from a conference the papers published here have been integrated into book form to provide information on human activities and the tropical rainforest in the past and present and on the possible future of the rainforest in a unique way Other books have considered some but not all of these themes however none has stressed the continuity of change over time and its possible outcome for the people of the forest as well as for the forest itself Because of the approach taken this book should appeal across traditional disciplinary boundaries Indeed a prime aim has been to suggest that rainforest because of its complexity and the complexity of people rainforest relationships throughout time deserves study from a broad perspective This book poses more questions than answers about the rainforest and it is hoped that it will encourage readers to think about the rainforest in a wider way than hitherto This book is aimed at geographers physical and human social anthropologists archaeologists pedologists foresters and tropical botanists and will be of value to graduates of various disciplines setting out to research the rainforest **Pedodiversity** Juan José Ibáñez,James G.

Bockheim,2013-04-08 Soil diversity pedodiversity is part of our natural and cultural heritage The preservation of the pedosphere is essential for the protection of the biosphere and the Earth s systems the regulation of climate and for world food security In this book reputed international experts discuss the state of the art of pedodiversity analysis analyzing

Rocks and Landforms John Gerrard,2012-12-06 Geomorphology can be defined simply as the study of landforms Landforms are the result of the interaction between what Ritter 1978 has called the driving and resisting forces The driving forces or processes are the methods by which energy is exerted on earth materials and include both surface geomorphological or exogenous processes and subsurface geological or endogenous processes The resisting forces are the surface materials with their inherent resistances determined by a complex combination of rock properties Stated in these simple terms it would be expected that both sides of the equation be given equal weight in syntheses of landform evolution However this has not been the case Until about the 1950s geomorphology was mainly descriptive and concerned with producing time dependent models of landscape evolution Although the form of the land was the main focus there was little detailed mention of process and scant attention to the properties of surface materials There were of course exceptions In the late 19th century G K Gilbert was stressing the equilibrium between landforms and processes Many hydrologists were examining the detailed workings of river systems and drainage basins culminating in the classic paper of Horton 1945
