Heavy-Tail Phenomena Sidney I. Resnick, 2007 This comprehensive text gives an interesting and useful blend of the mathematical probabilistic and statistical tools used in heavy tail analysis It is uniquely devoted to heavy tails and emphasizes both

probability modeling and statistical methods for fitting models Prerequisites for the reader include a prior course in stochastic processes and probability some statistical background some familiarity with time series analysis and ability to use a statistics package This work will serve second year graduate students and researchers in the areas of applied mathematics statistics operations research electrical engineering and economics *Extreme Value Theory for Time Series* Thomas Mikosch,Olivier Wintenberger,2024-08-02 This book deals with extreme value theory for univariate and multivariate time series models characterized by power law tails These include the classical ARMA models with heavy tailed noise and financial econometrics models such as the GARCH and stochastic volatility models Rigorous descriptions of power law tails are provided through the concept of regular variation Several chapters are devoted to the exploration of regularly varying structures The remaining chapters focus on the impact of heavy tails on time series including the study of extremal cluster phenomena through point process techniques A major part of the book investigates how extremal dependence alters the limit structure of sample means maxima order statistics sample autocorrelations This text illuminates the theory through hundreds of examples and as many graphs showcasing its applications to real life financial and simulated data The book can serve as a text for PhD and Master courses on applied probability extreme value theory and time series analysis It is a unique reference source for the heavy tail modeler Its reference quality is enhanced by an exhaustive bibliography annotated by notes and comments making the book broadly and easily accessible **Introductory Lectures on Fluctuations of Lévy Processes**

with Applications Andreas E. Kyprianou,2006-12-18 This textbook forms the basis of a graduate course on the theory and applications of Lévy processes from the perspective of their path fluctuations The book aims to be mathematically rigorous while still providing an intuitive feel for underlying principles The results and applications often focus on the case of Lévy processes with jumps in only one direction for which recent theoretical advances have yielded a higher degree of mathematical transparency and explicitness **Modelling Extremal Events** Paul Embrechts,Claudia Klüppelberg,Thomas Mikosch,2013-01-02 A reader's first impression on leafing through this book is of the large number of graphs and diagrams used to illustrate shapes of distributions and to show real data examples in various ways A closer reading reveals a nice mix of theory and applications with the copious graphical illustrations alluded to Such a mixture is of course dear to the heart of the applied probabilist statistician and should impress even the most ardent theorists MATHEMATICAL REVIEWS

Stochastic Processes and Long Range Dependence Gennady Samorodnitsky,2016-11-09 This monograph is a gateway for researchers and graduate students to explore the profound yet subtle world of long range dependence also known as long memory The text is organized around the probabilistic properties of stationary processes that are important for determining the presence or absence of long memory The first few chapters serve as an overview of the general theory of stochastic processes which gives the reader sufficient background language and models for the subsequent discussion of long memory The later chapters devoted to long memory begin with an introduction to the subject along with a brief history of its

development followed by a presentation of what is currently the best known approach applicable to stationary processes with a finite second moment The book concludes with a chapter devoted to the author's own less standard point of view of long memory as a phase transition and even includes some novel results Most of the material in the book has not previously been published in a single self contained volume and can be used for a one or two semester graduate topics course It is complete with helpful exercises and an appendix which describes a number of notions and results belonging to the topics used frequently throughout the book such as topological groups and an overview of the Karamata theorems on regularly varying functions

Inference for Heavy-Tailed Data Liang Peng, Yongcheng Qi, 2017-08-11 Heavy tailed data appears frequently in social science internet traffic insurance and finance Statistical inference has been studied for many years which includes recent bias reduction estimation for tail index and high quantiles with applications in risk management empirical likelihood based interval estimation for tail index and high quantiles hypothesis tests for heavy tails the choice of sample fraction in tail index and high quantile inference These results for independent data dependent data linear time series and nonlinear time series are scattered in different statistics journals Inference for Heavy Tailed Data Analysis puts these methods into a single place with a clear picture on learning and using these techniques Contains comprehensive coverage of new techniques of heavy tailed data analysis Provides examples of heavy tailed data and its uses Brings together in a single place a clear picture on learning and using these techniques

High Risk Scenarios and Extremes A. A. Balkema, Paul Embrechts, 2007 Quantitative Risk Management QRM has become a field of research of considerable importance to numerous areas of application including insurance banking energy medicine reliability Mainly motivated by examples from insurance and finance the authors develop a theory for handling multivariate extremes The approach borrows ideas from portfolio theory and aims at an intuitive approach in the spirit of the Peaks over Thresholds method The point of view is geometric It leads to a probabilistic description of what in QRM language may be referred to as a high risk scenario the conditional behaviour of risk factors given that a large move on a linear combination portfolio say has been observed The theoretical models which describe such conditional extremal behaviour are characterized and their relation to the limit theory for coordinatewise maxima is explained The book is based on a graduate course on point processes and extremes It could form the basis for an advanced course on multivariate extreme value theory or a course on mathematical issues underlying risk Students in statistics and finance with a mathematical quantitative background are the prime audience Actuaries and risk managers involved in data based risk analysis will find the models discussed in the book stimulating The text contains many indications for further research

Kyprianou, 2022-01-01 This collection honours Ron Doney's work and includes invited articles by his collaborators and friends After an introduction reviewing Ron Doney's mathematical achievements and how they have influenced the field the contributed papers cover both discrete time processes including random walks and variants thereof

and continuous time processes including Levy processes and diffusions A good number of the articles are focused on classical fluctuation theory and its ramifications the area for which Ron Doney is best known

Heavy Tailed Functional Time Series Thomas Meinguet, 2010-08 The goal of this thesis is to treat the temporal tail dependence and the cross sectional tail dependence of heavy tailed functional time series Functional time series are aimed at modelling spatio temporal phenomena for instance rain temperature pollution on a given geographical area with temporally dependent observations Heavy tails mean that the series can exhibit much higher spikes than with Gaussian distributions for instance In such cases second moments cannot be assumed to exist violating the basic assumption in standard functional data analysis based on the sequence of autocovariance operators As for random variables regular variation provides the mathematical backbone for a coherent theory of extreme values The main tools introduced in this thesis for a regularly varying functional time series are its tail process and its spectral process These objects capture all the aspects of the probability distribution of extreme values jointly over time and space The development of the tail and spectral process for heavy tailed functional time series is followed by three theoretical applications The first application is a characterization of a variety of indices and objects describing the extremal behavior of the series the extremal index tail dependence coefficients the extremogram and the point process of extremes The second is the computation of an explicit expression of the tail and spectral processes for heavy tailed linear functional time series The third and final application is the introduction and the study of a model for the spatio temporal dependence for functional time series called maxima of moving maxima of continuous functions CM3 processes with the development of an estimation method

Sojourns And Extremes of Stochastic Processes Simeon Berman, 2017-07-12 Sojourns and Extremes of Stochastic Processes is a research monograph in the area of probability theory During the past thirty years Berman has made many contributions to the theory of the extreme values and sojourn times of the sample functions of broad classes of stochastic processes These processes arise in theoretical and applied models and are presented here in a unified exposition

Extreme Values In Random Sequences Pavle Mladenović, 2024-05-17 The main subject is the probabilistic extreme value theory The purpose is to present recent results related to limiting distributions of maxima in incomplete samples from stationary sequences and results related to extremal properties of different combinatorial configurations The necessary contents related to regularly varying functions and basic results of extreme value theory are included in the first two chapters with examples exercises and supplements The motivation for consideration maxima in incomplete samples arises from the fact that real data are often incomplete A sequence of observed random variables from a stationary sequence is also stationary only in very special cases Hence the results provided in the third chapter are also related to non stationary sequences The proof of theorems related to joint limiting distribution of maxima in complete and incomplete samples

requires a non trivial combination of combinatorics and point process theory Chapter four provides results on the asymptotic behavior of the extremal characteristics of random permutations the coupon collector s problem the polynomial scheme random trees and random forests random partitions of finite sets and the geometric properties of samples of random vectors The topics presented here provide insight into the natural connections between probability theory and algebra combinatorics graph theory and combinatorial geometry The contents of the book may be useful for graduate students and researchers who are interested in probabilistic extreme value theory and its applications Encyclopaedia of Mathematics Michiel
