Regulation Of Hepatic Metabolism

Raymond S. Ochs

Regulation Of Hepatic Metabolism:

Aspects of Regulation of Hepatic Metabolism Raymond S. Ochs, 1979 Regulation of Hepatic Metabolism, 1974

Regulation of Hepatic Metabolism K. Jungermann, F.C. Kauffman, R.G. Thurman, 2012-12-06 The liver is an exceptionally complex and diverse organ that functions both as an exocrine and an endocrine gland. It secretes bile which contains many constituents in addition to bile salts and it synthesizes and releases many substances in response to the body's demands including prohormones, albumin, clotting factors, glucose, fatty acids, and various lipoproteins. It has a dual blood supply providing a rich mixture of nutrients and other absorbed substances via the portal vein and oxygen-rich blood via the hepatic artery. This functional heterogeneity is accompanied by cellular heterogeneity. The liver contains many cell types including hepatic parachymal cells, Kiipffer cells, Ito cells, and endothelial cells. The most abundant cell type, the parenchymal cells, are biochemically and structurally heterogeneous. The cells in the oxygen-rich areas of the portal triad appear more dependent on oxidative metabolism, whereas those around the central vein, pericentral, perivenous, or centrolobular areas are more dependent upon an anaerobic mechanism. Throughout this volume, the latter three terms are used synonymously by various authors to indicate the five to eight layers of cells radiating from the central vein. Structural and metabolic heterogeneity of hepatic parenchymal cells has been demonstrated by a variety of approaches including histochemical, ultrastructural, and ultramicrobiochemical studies. This microheterogeneity is linked to the physiological functions of the liver and its response to injurious substances. Regulation of Hepatic Metabolism Frank Lundquist, Niels Tygstrup, 1974

Regulation of Hepatic Metabolism Frank Lundquist, Niels Tygstrup, 1974 **Studies on the Hormonal Regulation of Hepatic Metabolism** Kevin M. Conricode, 1990 Regulation of Hepatic Metabolism Through PGC-1 [alpha]-mediated Pathways Linda Grasfeder, 2007 PGC 1alpha is a transcriptional coactivator selectively expressed in tissues with high metabolic demands and induced by a variety of metabolic stressors including cold, exercise, and fasting. When expressed, PGC 1alpha can coactivate a number of transcription factors to coordinately activate metabolic pathways that supply tissues and the body with necessary nutrients. PGC 1alpha has emerged as a master controller of mitochondria and many of the processes focused within them, including oxidative phosphorylation, fatty acid oxidation, the TCA cycle, and free radical scavenging. PGC 1alpha also induces gluconeogenesis and expression of glucose transporters, thereby regulating blood glucose levels. Given this integral role in modulating energy homeostasis, understanding how PGC 1alpha functions and what factors regulate its activity could help identify processes and proteins that malfunction in various metabolic disorders. **Research Awards Index**, 1982 Regulation of Hepatic Metabolism, 1974 **The Warburg Effect Regulation Under Siege: The Intertwined Pathways in Health and Disease** Concetta Bubici, Salvatore Papa, 2019-10-17 Many cells, including immune, neuronal, cancer, and stem cells, become dependent on aerobic glycolysis to escape apoptosis and accommodate their bioenergetics needs. How this metabolic change, also known as the Warburg effect, is regulated remains largely unknown. The

Warburg effect has been widely investigated in cancer cells where it was first observed with the aim of decoding the molecular networks controlling its activation for therapeutic purposes This Research Topic aimed to discuss and review all the intracellular signaling regulating the Warburg effect in cancerous and normal non cancerous cells though original research articles mini reviews and reviews

Liver is a key regulator of systemic metabolism in physiology and pathology It maintains cholesterol triglyceride and glucose homeostasis in response to fasting and feeding Transcription factors responsive to hormones and nutrients coordinate many of these responses They regulate gene networks relating to lipid glucose and amino acid metabolism during fasting and feeding and factors such as sex circadian rhythms and dietary content interact with these transcriptional programs as reviewed in chapter 1 Understanding the different players in these processes and how they interact with each other will be key to develop strategies to combat metabolic diseases Recent advances in probing the transcriptional landscape coupled with high throughput sequencing approaches such as assay for transposase accessible chromatin ATAC Seq have enabled the identification of transcriptional regulators of these processes and their interrelationships In chapter 2 I describe results from a screen using ATAC Seq and RNA Seq to profile novel transcriptional regulators of the hepatic response to fasting and feeding We determined GATA4 expression and activity to be upregulated by feeding through insulin Knocking out Gata4 in adult liver impaired the transcriptional and metabolic response to feeding Additionally loss of hepatic GATA4 led to a reduction in HDL cholesterol and to the accumulation of liver triglycerides These effects were accompanied by the downregulation of genes involved in cholesterol efflux and triglyceride hydrolysis and the upregulation of genes involved in lipid uptake Furthermore hepatic GATA4 colocalized and collaborated with Liver X Receptor LXR a key regulator of cholesterol transport In chapter 3 I investigated the dynamics of hepatic LXRs via ATAC Seq and RNA Seq in wild type and LXR alpha Beta knockout liver Loss of LXRs in liver changed the transcriptional regulatory landscape by reducing accessibility at enhancers and increasing accessibility at promoters A broad set of transcription factors that bind enhancers including nuclear receptors had reduced activity based on their motif accessibility showing their reliance on LXRs Moreover this investigation demonstrated that LXR also functions as a transcriptional repressor of certain genes Overall these studies revealed important functions for GATA4 and LXR within hepatic transcriptional networks extending our understanding of transcriptional regulation of hepatic lipid metabolism
