Principles Of Chemical Kinetics:

Principles of Chemical Kinetics James E. House, 2007-08-30 James House's revised *Principles of Chemical Kinetics* provides a clear and logical description of chemical kinetics in a manner unlike any other book of its kind. Clearly written with detailed derivations, the text allows students to move rapidly from theoretical concepts of rates of reaction to concrete applications. Unlike other texts, House presents a balanced treatment of kinetic reactions in gas solution and solid states. The entire text has been revised and includes many new sections and an additional chapter on applications of kinetics. The topics covered include quantitative relationships between molecular structure and chemical activity, organic inorganic chemistry, biochemical kinetics, surface kinetics, and reaction mechanisms. Chapters also include new problems with answers to selected questions to test the reader's understanding of each area. A solutions manual with answers to all questions is available for instructors. A useful text for both students and interested readers alike. Dr. House has once again written a comprehensive text simply explaining an otherwise complicated subject. Provides an introduction to all the major areas of kinetics and demonstrates the use of these concepts in real life applications. Detailed derivations of formula are shown to help students with a limited background in mathematics. Presents a balanced treatment of kinetics of reactions in gas phase solutions and solids. Solutions manual available for instructors.

Principles of Chemical Kinetics Gorden Hammes, 2012-12-02 *Principles of Chemical Kinetics* is devoted to the principles and applications of chemical kinetics. The phenomenology and commonly used theories of chemical kinetics are presented in a critical manner with particular emphasis on collision dynamics. How and what mechanistic information can be obtained from various experimental approaches is stressed throughout this book. Comprised of nine chapters, this text opens with an overview of reaction rates and their empirical analysis along with theories of chemical kinetics. The following chapters consider reactions and unimolecular decompositions in the gas phase, chemical reactions in molecular beams and energy transfer and partitioning in chemical reactions. Kinetics in liquid solutions and fast reactions in liquids are also described. The final chapter looks at the kinetics of enzymes with particular reference to steady state and transient state kinetics, the pH and temperature dependence of kinetic parameters and the mechanism underlying enzymatic action. This monograph is intended for students with a general college background in chemistry, physics and mathematics and with a typical undergraduate course in physical chemistry.
