Principles Of Network & System Admin. 2Nd Ed. Mark Burgess, 2004-03 Market_Desc Students and novice system administrators Professional network and systems administrators Special Features Coverage of both network and system administration from the perspective of the underlying principles that do not change on a day to day basis Shows how to discover customer needs and then use that information to identify interpret and evaluate system and network requirements Fully updated to cover new technologies including Java Services and Ipv6 and both Unix and Windows systems Extended coverage of security including ISO 17799 About The Book Burgess approaches both network and system administration from the perspective of principles and ideas which do not change on a day to day basis A great deal of attention is paid to the heuristics of system and network administration technical and sociological issues are taken into account equally and are presented thoughtfully with an eye to teaching not what to do as a system or network administrator but how to think about problems that arise in practice As a result the author keeps the reader looking forward to what comes next and how to implement what he or she has learned The focus is on strategic issues how to keep systems maintainable and how to manage configuration files across an enterprise During the 80s and most of the 90s the frontiers of system administration were about understanding what the job entailed and building tools in order to manage networks more efficiently The next phase is about standardization of management and practice making system administration more formal and less ad hoc and Burgess book is one of the first to begin to push into this area Whilst there are multitudes of ways to become a systems administrator many employers prefer to hire people with some formal college education Certification and practical experience demonstrating these skills will be essential for applicants without a degree Systems administrators must keep their skills current and acquire new ones

Networking for System Administrators Michael W Lucas, Stop waiting for the network team If basic TCP IP was hard network administrators couldn't do it Servers give sysadmins a incredible visibility into the network once they know how to unlock it Most sysadmins don't need to understand window scaling or the differences between IPv4 and IPv6 echo requests or other intricacies of the TCP IP protocols You need only enough to deploy your own applications and get easy support from the network team This book teaches you How modern networks really work The essentials of TCP IP The next generation protocol IPv6 The right tools to diagnose network problems and how to use them Troubleshooting everything from the physical wire to DNS How to see the traffic you send and receive Connectivity testing How to communicate with your network team to quickly resolve problems A systems administrator doesn't need to know the innards of TCP IP but knowing enough to diagnose your own network issues transforms a good sysadmin into a great one

Principles of

Computer Systems and Network Management Dinesh Chandra Verma, 2010-01-23 As computer systems and networks have evolved and grown more complex the role of the IT department in most companies has transformed primarily to ensuring that they continue to operate without disruption IT spending as reported by a variety of studies shows the trend that most of the expenses associated with IT are related to the task of operating and managing installed computer systems and applications Furthermore the growth in that expense category is outstripping the expense associated with developing new applications As a consequence there is a pressing need in the companies and organizations to find qualified people who can manage the installed base of computer systems and networks This marks a significant shift from the previous trend in companies where the bulk of the IT department expenses were targeted on development of new computer applications The shift from developing new applications to managing existing systems is a natural consequence of the maturity of IT industry Computers are now ubiquitous in every walk of life and the number of installed successful applications grows steadily over the time Each installed successful application in a company lasts for a long duration Consequently the number of installed applications is much larger than the number of projects focused on developing new applications While there always will be new applications and systems being developed within companies the predominance of managing and operating existing applications is likely to continue
