Hocking, 2012-12-06 This text of applied chemistry considers the interface between chemistry and chemical engineering using examples of some of the important processes in industries Integrated with this is detailed consideration of measures which may be taken for avoidance or control of potential emissions This new emphasis in applied chemistry has been developed through eight years of experience gained from working in industry in research development and environmental control fields plus twelve years of teaching here using this approach It is aimed primarily towards science and engineering students as well

as to environmentalists and practising professionals with responsibilities or an interest in this interface By providing the appropriate process information back to back with emissions and control data the potential for process fine tuning is improved for both raw material efficiency and emission control objectives This approach also emphasizes integral process changes rather than add on units for emission control Add on units have their place when rapid action on an urgent emission problem is required or when control simply is not feasible by process integral changes alone Obviously fundamental process changes for emission containment are best conceived at the design stage However at whatever stage process modifications are installed this approach to control should appeal to the industrialist in particular in that something more substantial than decreased emissions may be gained

Conservation of Marine Archaeological Objects Colin Pearson, 2014-05-20 Over the past twenty years there has been a significant increase in underwater activities such as scuba diving which coupled with the adventure and romance always associated with shipwrecks has led to rapid developments in the discovery and excavation of shipwrecked material These shipwrecks are invaluable archaeological time capsules which in the majority of cases have come to an equilibrium with their environment As soon as artefacts on the wreck site are moved this equilibrium is disturbed and the artefacts may commence to deteriorate sometimes in a rapid and devastating fashion In fact excavation without having conservation facilities available is vandalism the artefacts are much safer being left on the sea bed Such famous shipwrecks as the Mary Rose 1545 the *Wasa* 1628 and the *Batabia* 1629 have not only brought the world's attention to these unique finds but have also produced tremendous conservation problems The treatment of a 30 metre waterlogged wooden hull or large cast iron cannon is still causing headaches to conservators
