Rodents Sara Swan Miller, 1998-01-01 A general overview of rodents including a description of fourteen species and recommendations for observing them      **Rodents** Sara Swan Miller, 1998 A general overview of rodents including a description of fourteen species and recommendations for observing them      *Mammals of the Eastern United States* John O. Whitaker, William John Hamilton, 1998 In Their Definitive Work on eastern mammals John O Whitaker Jr and William J Hamilton Jr vividly convey their sheer delight at the variety and abundance of mammalian life They have brought together a wealth of biological information and applied a biological subspecies concept to the mammals of the eastern United States

Resolving Human-Wildlife Conflicts Michael R. Conover, 2001-08-29 As more and more people crowd onto less and less land incidences of human wildlife conflicts will only increase A comprehensive overview of this emerging field Resolving Human Wildlife Conflicts The Science of Wildlife Damage Management discusses the issues facing wildlife managers and anyone else dealing with interactions between wildlife and      The physiological consequences of breath-hold diving in marine mammals; the Scholander legacy Andreas Fahlman, Breath hold diving marine mammals are able to remain submerged for prolonged periods of time and dive to phenomenal depths while foraging A number of physiological biochemical and behavioral traits have been suggested that enable this life style including the diving response lung collapse increased O<sub>2</sub> stores diving induced hypometabolism and stroke and glide behavior to reduce dive metabolic cost Since the initial studies by Scholander in the 1940 s when most of the physiological and biochemical traits were suggested few have received as much study as the diving response and O<sub>2</sub> management The calculated aerobic dive limit cADL was an important concept which allowed calculation of the aerobic dive duration and was defined as the total O<sub>2</sub> stores divided by the rate of O<sub>2</sub> consumption metabolic rate The total O<sub>2</sub> stores have been defined for several species and studies in both forced and freely diving animals have refined the metabolic cost of diving Currently there appears to be little consensus about whether marine mammals perform a significant proportion of dives exceeding the cADL or not and there may be large differences between species The diving response is a conserved physiological trait believed to arise from natural selection The response includes diving induced bradycardia peripheral vasoconstriction and altered blood flow distribution While the response results in reduced cardiac work it is not clear whether this is required to reduce the overall metabolic rate An alternate hypothesis is that the primary role of the diving bradycardia is to regulate the degree of hypoxia in skeletal muscle so that blood and muscle O<sub>2</sub> stores can be used more efficiently Scholander suggested that the respiratory anatomy of marine mammals resulted in alveolar collapse at shallow depths lung collapse thereby limiting gas exchange This trait would limit uptake of N<sub>2</sub> and thereby reduce the risk of inert gas bubble formation and decompression sickness In his initial treatise Scholander suggested that alveolar collapse probably made inert gas bubble formation unlikely during a single dive but that repeated dives could result in significant accumulation that could be risky Despite this lung collapse has been quoted as the

main adaptation by which marine mammals reduce N<sub>2</sub> levels and inert gas bubble formation. It was surprising therefore when recent necropsy reports from mass stranded whales indicated DCS like symptoms. More recent studies have shown that live marine mammals appear to experience bubbles under certain circumstances. These results raise some interesting questions. For example, are marine mammals ever at risk of DCS and if so, could N<sub>2</sub> accumulation limit dive performance? While an impressive number of studies have provided a theoretical framework that explains the mechanistic basis of the diving response and O<sub>2</sub> management, many questions remain. Some widely accepted ideas actually lack sufficient experimental confirmation and a variety of marine mammal species potentially novel models for elucidating new diving adaptations are understudied. The aim of this Frontiers Topic is to provide a synthesis of the current knowledge about the physiological responses of marine mammals that underlie their varied dive behavior. We also include novel contributions that challenge current ideas and that probe new hypotheses, utilize new experimental approaches and explore new model species. We show that the field has recently entered a phase of renewed discovery that is not only unraveling more secrets of the natural diving response but will drive new applications to aid human exploration of the ocean depths. We also welcome comparative analyses, especially contributions that compare marine mammals with human divers.

*Pathology of Wildlife and Zoo Animals* is a comprehensive resource that covers the pathology of wildlife and zoo species including a wide scope of animals, disease types and geographic regions. It is the definitive book for students, biologists, scientists, physicians, veterinary clinicians and pathologists working with non-domestic species in a variety of settings. General chapters include information on performing necropsies, proper techniques to meet the specialized needs of forensic cases, laboratory diagnostics and an introduction into basic principles of comparative clinical pathology. The taxon-based chapters provide information about disease in related groups of animals and include descriptions of gross and histologic lesions, pathogenesis and diagnostics. For each group of animals, notable unique gross and microscopic anatomical features are provided to further assist the reader in deciding whether differences from the domestic animal paradigm are normal. Additional online content which includes text, images and whole scanned glass slides of selected conditions expands the published material, resulting in a comprehensive approach to the topic.

Presents a single resource for performing necropsies on a variety of taxa including terrestrial and aquatic vertebrates and invertebrates. Describes notable unique gross and microscopic anatomical variations among species taxa to assist in understanding normal features, in particular those that can be mistaken as being abnormal. Provides consistent organization of chapters with descriptions of unique anatomic features, common non-infectious and infectious diseases, following brief overviews of the taxonomic group. Contains full color, high quality illustrations of diseases. Links to a large online library of scanned slides related to topics in the book that illustrate

Nelson's authoritative narrative serves as both an informative guide and a heartfelt advocacy for the conservation of North America's rich biodiversity making it a must read for anyone invested in wildlife ecology or the natural world     *The National Geographic Magazine* ,1918     **The Nature Library** ,1920     *American Animals* Witmer Stone,William Everett Cram,1902     A Manual of Land and Fresh Water Vertebrate Animals of the United States (exclusive of Birds) Henry Sherring Pratt,1923 The naturalist frequently finds that to learn to identify species is a most difficult task and yet nothing is more important to his work He finds that species are not separated merely on shape and colour but on structural peculiarities which frequently are connected with particular habits This is especially the case in vertebrate animals which in Great Britain with its very limited number of forms may be identified in a haphazard manner by elimination This is impossible in a country where different climatic areas interdigitate and where there are many species as the United States which for the purpose of the naturalist is a continent Here Prof H S Pratt fills the bill by his *Vertebrate Animals of the United States* which however omits birds A short account of each group is given the anatomical features dividing it up into sub groups and families being usually illustrated Where necessary special features for families are described and then follow keys to the genera descriptions of the same and keys to their species The whole closes with a good bibliography and a glossary of technical terms The short descriptions of each species with mention of their geographical distributions and habitats are excellent and the tabulation of the sub species most useful We learn that there are about 600 species of freshwater fishes 70 of newts and 61 of frogs and toads we are given a key by which their tadpoles and eggs can be identified 300 reptiles and a wide series of mammals belonging to 9 orders We characterise this publication as a book for ready reference such as should be on the shelves of all American naturalists
