Postimplantation Development in the Mouse Derek J. Chadwick, Joan Marsh, 2008-04-30 Examines the establishment of the germ layers and other cell lineages in the early embryo including details of cell movements during the beginning stages of primitive streak formation Discusses patterns of gene expression during the development of such tissues as the limb bud skeletal muscle and the central nervous systems placing special emphasis on commitment to particular cell types Although it concentrates on the mouse as an example of mammalian development chick amphibian and Drosophila embryogenesis are employed whenever these organisms are more applicable to the study of a particular problem **The Influence of Ploidy on the Pre- and Postimplantation Development of Mouse Embryos** Caroline Cecilia Henery, 1993 Cell Lineage and Embryo Patterning, 2000-12-13 International Review of Cytology presents current advances and comprehensive reviews in cell biology both plant and animal Articles address structure and control of gene expression nucleocytoplasmic interactions control of cell development and differentiation and cell transformation and growth Authored by some of the foremost scientists in the field each volume provides up to date information and directions for future research This volume brings together current information on the localization and roles of RNAs in cell lineage determination and subsequent patterning in embryonic development Guest co editor Lawrence Etkin is one of the leading researchers in molecular genetics of Xenopus Key Features A number of important concepts are discussed including How polarity is established during oogenesis How germ cell determinants become organized in the establishment of the germ cell lineage Different strategies used by organisms to establish the germ cell lineage Similarities and differences between the mechanisms used in embryonic patterning The mechanisms and machinery by which molecules such as RNA become asymmetrically segregated The use of similar signaling pathways in patterning of the dorsal ventral and right left asymmetries embryonic germ layers limb and nervous system The link between fundamental biological processes such as RNA translation and localization in the regulation of axis specification *Developmental Models 2.0* Mo Li, Keiichiro Suzuki, Alessandra Giorgetti, Ying Gu, 2022-11-16 Dr Ying Gu is employed by BGI Research all other Topic Editors declare no conflicts of interest Textbook of Assisted Reproductive Techniques David K. Jonge, Christopher L. R. Barratt, 2002-07-11 This text describes the rapid advances that have revolutionized reproductive medicine due to the result of converging and overlapping developments in reproductive biology molecular biology and genetics **The Mammalian Preimplantation Embryo** Barry D. Bavister, 2012-12-06 With a few notable exceptions mammalian preimplantation embryos grown in vitro are likely to exhibit sub optimal or retarded development This may be manifested in different ways depending on the species and on the stage s of embryonic development that are being examined

For example bovine embryos often experience difficulty in cleaving under in vitro conditions and usually cease development at about the 8 cell stage Wright and Bondioli 1981 The block to development is stage dependent embryos cultured for 24 hr from the 1 cell stage are much more capable of developing into viable blastocysts after transfer to oviducts than embryos cultured for 24 hr from the 4 cell stage prior to transfer Eystone et al 1985 Similar problems with in vitro embryo development are encountered in other species Pig embryos can be grown up to the 4 cell stage in vitro but usually no further Davis and Day 1978 In the golden hamster in the rat and in many outbred strains of mice development of zygotes in vitro is blocked at the 2 cell stage Yanagimachi and Chang 1964 Whittingham 1975 Even with some inbred mouse strains embryo development is reduced if very early cleavage stages are used as the starting point for in vitro culture Spielmann et al 1980 A common finding is that embryos grown in vitro have reduced cell counts Harlow and Quinn 1982 Kane 1985 and their viability is reduced Bowman and McLaren 1970 Papaioannou and Ebert 1986 compared to equivalent developmental stages recovered from mated animals

,1996 **Early Life Origins of Health and Disease** E. Marelyn Wintour-Coghlan, Julie Owens, 2007-02-26 Early Life Origins of Health and Disease is a new book which presents and discusses the many factors that may have impact on normal development In a concise and readable manner the authors consider both the proven and suggestive evidence that the high prevalence of hypertension diabetes obesity and in some populations kidney disease may not be all due to genetics or adult environment alone There is good evidence that stress and more subtle dietary deficiencies as well as placental malfunction may increase the risk that the offspring will develop these problems in later life Finally new and emerging evidence for other areas of human health and disease such as motor control and mental health is critically reviewed for the first time The book is a must for all scientists interested in researching these areas as there is a critical evaluation of the methodology used and suggestions for the optimal way in which to investigate these phenomena

developmental biology The book is composed of sections that deal with various aspects of genetic mechanisms The first section tackles the genetic analysis of gene regulation in microorganisms The second section discusses the application of Mendelian genetics to the study of the development of Drosophila amphibians and the laboratory mouse The last section introduces somatic cell genetics a tool for developmental biologists Biologists geneticists zoologists and researchers will find the book a good source of information

Early Embryonic Development of Animals Wolfgang Hennig,2013-06-05 Four of the major animal systems studied for the mechanisms of their early embryonic development are treated in this volume The articles address the specific questions studied in the various systems discuss the fundamental questions raised by the particular organism and explain the techniques used to find answers to these questions Questions of patternformation early organogenesis and the genetics of the early development arecovered as well as the question of parental imprinting phenomena in mammals which are important for the early differentiation The development of the mouse Drosophila Caenorhabditis and the zebrafish is emphasized by leading experts of their fields and current problems in each system are exposed For the zebrafish the advantages of this new system for developmental biology studies are summarized and discussed in their values while in the other system the emphasis is laid on one of the actual field of research
