Variability and Individual Differences in Early Social Perception and Social Cognition Jessica Sommerville, Alia Martin, Talee Ziv, 2016-06-10 Over the past three decades mounting evidence has suggested that infants social perceptual and social cognitive abilities are considerably richer than was once thought By the end of the second year of life infants discriminate faces along various social dimensions attend to and understand others goals and intentions use the emotions of others to guide their learning and behavior attribute dispositional characteristics to other agents and make basic social evaluations What has also become clear is that there is a great deal of variability in infants social perception and cognition A critical outstanding question concerns the nature and meaning of such variability The proposed Research Topic welcomes papers addressing cutting edge questions regarding variability and individual differences in early social perception and social cognition The goal of these papers is to investigate overarching questions in this domain which are necessary to move the field forward Variability in early social perception and social cognition among other domains in infancy and early childhood is often attributed to noise or overlooked in favor of focusing on age related changes Yet recent work suggests that variability in social perceptual and social cognitive tasks reliably inter relates and predicts real world social behaviors For example infants everyday experience with different face categories predicts individual differences in face processing infants production of goal directed actions predicts their simultaneous understanding of these actions and variability in social attention during the second year of life is related to theory of mind during the preschool years These findings suggest that variability in performance on social perception and social cognition tasks is not merely a nuisance variable but rather may provide the key to addressing significant questions regarding the nature of infants social perception and social cognition and the processes that underlie developmental change

Acknowledging and closely examining and investigating variability in early social perceptual and social cognitive abilities may represent a powerful approach for understanding development in at least two ways First variability can signal transitional points in the developmental onset of a given ability Thus such variability and the extent to which variability relates to experience and or other abilities can be used to test hypotheses regarding mechanisms that underlie developmental changes Second variability can represent more enduring individual differences between infants In this case critical questions arise regarding the source of individual differences that is what factors shape the emergence of individual differences and whether such early individual differences contribute to the development of more advanced and sophisticated forms of social cognition and behavior The goal of this Research Topic will be to encourage researchers to take variability in early social perception and cognition seriously Papers that give variability center stage and are aimed at addressing the value of variability for identifying developmental mechanisms as well as investigating the existence source and antecedents of early individual differences in social perception and social cognition are welcomed Taken together the contributed papers will provide integral new information to the study of social perception and social cognition over the first three years of life

Moving and Interacting in Infancy and Early Childhood Silvia Español, Mauricio Martínez, Fernando G.

Rodríguez, 2022-09-08 This book introduces studies on infant and early childhood development that are in a permanent dialogue with the psychology of music the philosophy of mind and human movement studies They are based on an innovative framework that combines embodied cognition the multimodal approach to child development and the second person perspective in social cognition This frame of reference allows authors to revisit relevant topics in developmental psychology such as adult infant interactions early intersubjective experiences the development of perceptual verbal and gestural communication skills as well as the complexity of play in infancy and early childhood In the field of infancy and early childhood studies the three viewpoints brought together in this volume had a clear innovative impact Embodied psychology showed the body to be the primary agent in the interactions that shape the infant's psyche The second person perspective exhibited the direct transparent I-Thou contact involved in the first patterns of reciprocity between adult and infant and the multimodal theory of perceptual development revealed an infant immersed in a multisensory environment conveying information to all perceptual systems as a unified experience The studies presented in this volume combine these three viewpoints and link them through the use of analytical tools and concepts from the temporal arts music and dance This way of conducting empirical research on some central topics in early infancy led to an aesthetic conception of development that emphasizes bodily experience temporal affects and their intertwining with symbolic capacities Moving and Interacting in Infancy and Early Childhood An Embodied Intersubjective and Multimodal Approach to the Interpersonal World will provide innovative tools for developmental and cognitive psychologists studying the development of early socio-cognitive skills in infants and young children and will also serve as a rich source of information for researchers and practitioners in other fields

Cross-Disciplinary Approaches to Characterize Gait and Posture Disturbances in Aging and Related Diseases, volume II

Simone Tassani, Claudio Belvedere, Juan Ramírez, Giorgio Davico, 2024-06-06 Aging introduces disturbances to the gait and posture of individuals. Such alterations can originate or result from a wide range of causes making it challenging to understand when modifications are related to pathological or physiological causes. Many disciplines come together to perform this kind of analysis e.g. computational and experimental mechanics, image processing, medicine, biology, physiology, machine learning, and data science. Gait analysis is particularly sensitive to the interactions of different disciplines. This technique allows the study of human movements but only through a multidisciplinary approach it is possible to infer relations of causation. Narrow studies focusing on specific techniques are important to develop the fundamental tools required to study movement. In recent years, significant methodological advancements have been independently made in these fields. However, to cross the borders of current science and develop consistent results, any new study needs to set interdisciplinary goals. An inclusive approach merging multiple aspects would be key in targeting pharmacological or rehabilitation interventions and improving patient care as a whole.
