

T Cell Receptor Structure and Function

Structure

The T cell receptor (TCR) is a transmembrane protein complex, consisting of an α and β chain, each with a variable and constant region. TCRs are associated with CD3 proteins, which mediate signal transduction.

Diversity

TCR diversity is generated through V(D)J recombination, enabling T cells to recognize a wide range of peptide antigens.

Function

TCRs recognize short peptide fragments presented by MHC molecules on antigen-presenting cells (APCs). This interaction initiates T cell activation and differentiation into effector cells.

Nuclear Receptors: From

Structure to the Clinic Iain J. McEwan, Raj Kumar, 2015-08-20 Nuclear Receptors focuses on the structural analysis of nuclear receptors from the initial work using isolated protein domains to the more recent exciting developments investigating the conformational shape of full length receptor complexes The book also reviews the structure of key nuclear receptor co regulatory proteins It brings together for the first time a comprehensive review of nuclear receptor structure and the importance of receptor conformation underpinning allosteric regulation by different ligands hormone drugs DNA response elements protein protein interactions and receptor activity The nuclear receptor superfamily including receptors for steroid hormones and non steroid ligands are pivotal to normal physiology regulating processes as diverse as reproduction metabolism the immune system and brain development The first members of the family were cloned over 25 years ago which heralded in the idea of a superfamily of intracellular receptor proteins that bound small molecule ligands classical steroid hormones vitamins fatty acids and other products of metabolism These signals are then transmitted through multiprotein receptor DNA complexes leading to the regulation of target genes often in a cell selective manner The cloning of the receptor cDNAs also ushered in an era of unparalleled analysis of the mechanisms of action of these ligand activated transcription factors

Ganglioside Structure, Function, and Biomedical Potential Robert W. Ledeen, 2012-12-06 This volume contains the proceedings of the symposium on Ganglioside Structure Function and Biomedical Potential which was held at Parksville Vancouver Island B C Canada on July 6 10 1983 The symposium was organized as a satellite to the ninth meeting of the International Society for Neurochemistry held immediately afterward in Vancouver City B C Close to 50 speakers from 9 countries presented papers on a wide range of topics on the ganglioside theme These encompassed the many aspects of basic research that have evolved over the past half century as well as some newer topics relating to the biomedical potential of gangliosides as therapeutic agents One of the purposes of the meeting was to encourage dialogue between investigators in these seemingly diverse areas in the hope that each would come away with fresh perspective toward his own work Judging from the many spirited informed discussions that took place throughout the four day meeting this goal was achieved The charm and beauty of Vancouver Island undoubtedly contributed to the congenial atmosphere which quickly developed among the 120 or so participants Drawn from 13 countries of Europe East and West America North and South Asia and the Middle East this gathering reflected the broad geographical scale on which ganglioside research is now conducted That this field is still in its logarithmic stage of growth is indicated by the increasing number of citations appearing each year in the various abstracts e g fig next page
