Model Reduction Methods for Vector Autoregressive Processes Ralf Brüggemann, 2012-09-25 1 1 Objective of the Study Vector autoregressive VAR models have become one of the dominant research tools in the analysis of macroeconomic time series during the last two decades The great success of this modeling class started with Sims 1980 critique of the traditional simultaneous equation models SEM Sims criticized the use of too many incredible restrictions based on supposed a priori knowledge in large scale macroeconometric models which were popular at that time Therefore he advocated largely unrestricted reduced form multivariate time series models unrestricted VAR models in particular Ever since his influential paper these models have been employed extensively to characterize the underlying dynamics in systems of time series In particular tools to summarize the dynamic interaction between the system variables such as impulse response analysis or forecast error variance decompositions have been developed over the years The econometrics of VAR models and related quantities is now well established and has found its way into various textbooks including inter alia Lütkepohl 1991 Hamilton 1994 Enders 1995 Hendry 1995 and Greene 2002 The unrestricted VAR model provides a general and very flexible framework that proved to be useful to summarize the data characteristics of economic time series Unfortunately the flexibility of these models causes severe problems In an unrestricted VAR model each variable is expressed as a linear function of lagged values of itself and all other variables in the system
