*Principles and Practice of Pediatric Endocrinology* Michael Steven Kappy, David B. Allen (Pediatric endocrinologist), Mitchell E. Geffner, 2005 This first edition of Principles and Practice of Pediatric Endocrinology brings together 30 authors from 4 countries to present an update on the molecular basis of endocrine disorders in infants children and adolescents as well as the diagnosis and treatment of these conditions It is intended for the use of practitioners fellows and clinical and bench top researchers in this field and presents advances in each of 12 areas of the normal and abnormal endocrine state The work is a tribute to all those past and present whose research and clinical efforts resulted in the rapidly increasing accumulation of knowledge in this field and includes comprehensive practical clinical presentations in the form of an Atlas following each chapter after the comprehensive introductory chapter by Drs Root and Rogol This publication owes a great debt to Lawson Wilkins a Baltimore pediatrician who first formally established the separate discipline of pediatric endocrinology to Edwards Park Fuller Albright Bob Blizzard Claude Migeon Harold and Helen Harrison James Tanner and to so many others giants upon whose shoulders

pediatric endocrinologists stand Disorders of growth and pubertal development are the cornerstones of pediatrics as they are present in many children with chronic illness as well as in children whose growth and pubertal development are influenced by genetics and family history These may have identifiable causes in pituitary thyroid adrenal or gonadal function and examples are well represented in this book Obesity and diabetes types I and 2 are likewise diseases of childhood that are becoming increasingly and significantly prevalent and are included in this work Disorders of calcium phosphorus especially the often forgotten but not gone Vitamin D deficiency rickets and water metabolism are presented and errors of sexual differentiation an increasingly controversial issue are highlighted It is the hope of the editors that this work will assist the practitioner and researcher in this field in his or her efforts to diagnose treat and establish the etiology of endocrine disorders in infants children and adolescents

**Hormonal Regulation of Mammary Tumors** Benjamin S. Leung, 2012-12-06 The concept that hormones influence tumor growth originated in 1889 with the proposal of Albert Schinzinger who suggested that breast cancer is related to the ovaries Several years later Sir George Beatson observed that remission of disseminated breast cancer could be achieved in premenopausal patients by performing bilateral oophorectomy As a result of the contributions of Hedley Atkins Charles Huggins and others additive and ablative hormonal therapies have been widely used for the treatment of advanced breast cancers for several decades Model systems to study the effects of hormones on growth and regression of breast tumors have been available for many years however the complexities of the hormonal environment have rendered in vivo studies difficult in man and experimental animals Recently the availability of long term cultures of breast cancer cells has stimulated many investigators to use these cell lines to unravel the mechanisms of hormone action Because of the extreme diversity and complexity of advances regarding the endocrinology of the breast and breast cancers a multi authored review was deemed necessary It has been gratifying to receive contributions from many noted scholars In Volume I of this monograph the influence of steroid hormones and their antagonists upon normal and neoplastic tissues of the mammary gland are presented In Volume II the effects of peptide and other hormones are reviewed

Genome Wide Association Studies

GWAS are widely used in the genetic dissection of complex traits. Most existing methods are based on single marker association in genome wide scans with population structure and polygenic background controls. To control the false positive rate the Bonferroni correction for multiple tests is frequently adopted. This stringent correction results in the exclusion of important loci especially for GWAS in crop genetics. To address this issue multi locus GWAS methodologies have been recommended i.e. FASTmrEMMA, ISIS-EM, BLASSO, mrMLM, FASTmrMLM, pLARmEB, pKWmEB and FarmCPU. In this Research Topic our purpose is to clarify some important issues in the application of multi locus GWAS methods. Here we discuss the following subjects. First we discuss the advantages of new multi locus GWAS methods over the widely used single locus GWAS methods in the genetic dissection of complex traits: metabolites and gene expression levels. Secondly, large experiment error in the field measurement of phenotypic values for complex traits in crop genetics results in relatively large P values in GWAS indicating the existence of small number of significantly associated SNPs. To solve this issue a less stringent P value critical value is often adopted i.e.  $0.001/0.0001$  and  $1/m$  is the number of markers. Although lowering the stringency with which an association is made could identify more hits, confidence in these hits would significantly drop. In this Research Topic we propose a new threshold of significant QTN: LOD 3.0 or P value  $2.0 \times 10^{-4}$  in multi locus GWAS to balance high power and low false positive rate. Thirdly, heritability missing in GWAS is a common phenomenon and a series of scientists have explained the reasons why the heritability is missing. In this Research Topic we also add one additional reason and propose the joint use of several GWAS methodologies to capture more QTNs. Thus overall estimated heritability would be increased. Finally we discuss how to select and use these multi locus GWAS methods.
