

What Is the Predictive Value of Animal Models for Vaccine Efficacy in Humans?

Rigorous Simian Immunodeficiency Virus Vaccine Trials Can Be Instructive

Simian immunodeficiency virus (SIV) challenge of rhesus macaques provides an invaluable tool to evaluate the clinical prospects of HIV-1 vaccine concepts. However, as with any animal model of human disease, it is crucial to understand the advantages and limitations of this system to maximize the translational value of SIV vaccine studies. Here, we discuss the importance of assessing the efficacy of vaccine prototypes using stringent SIV challenge regimens that mimic HIV-1 transmission and pathogenesis. We also review some of the cautionary tales of HIV-1 vaccine research because they provide general lessons for the preclinical assessment of vaccine candidates.

GREAT DEBATES

What are the most interesting topics likely to come up over dinner or drinks with your colleagues? Or, more importantly, what are the topics that don't come up because they are a little too controversial? In *Immune Memory and Vaccines: Great Debates*, Editors Rafi Ahmed and Shane Crotty have put together a collection of articles on such questions, written by thought leaders in these fields, with the freedom to talk about the issues as they see fit. This short, innovative format aims to bring a fresh perspective by encouraging authors to be opinionated, focus on what is most interesting and current, and avoid restating introductory material covered in many other reviews.

The Editors posed 13 interesting questions critical for our understanding of vaccines and immune memory to a broad group of experts in the field. In each case, several different perspectives are provided. Note that while each author knew that there were additional scientists addressing the same question, they did not know who these authors were, which ensured the independence of the opinions and perspectives expressed in each article. Our hope is that readers enjoy these articles and that they trigger many more conversations on these important topics.

Early Phase Drug Evaluation in Man O'grady,2020-02-03 Early Phase Drug Evaluation in Man is a comprehensive practical guide that covers pre clinical information relevant to early human studies including pharmaceutical metabolic toxicological and regulatory aspects as well as the general considerations relevant to all early human studies Each major therapeutic area is considered by class of activity of drug The chapters describe what measurements of drug activity are available in healthy human subjects and in patients how to make the measurements their value and their limitations The contributors have been drawn internationally from the pharmaceutical industry and academia Early Phase Drug Evaluation in Man will provide an important reference guide for industry and academic professionals involved in the development of new drugs

The Future of Predictive Safety Evaluation A.N. Worden,D.V. Parke,J. Marks,2012-12-06 Reproduction and fetal development in humans and experimental animals may be adversely affected by a wide range of drugs and environmental agents They may be toxic in the parental generation leading to impaired germ cell formation loss of reproductive potential and infertility following chronic exposure Deviant fetal development occurs as a consequence of cellular damage at sensitive stages in development Changes seen range from intrauterine mortality and structural malformation to growth retardation with physiological and behavioural defects Concepts on the mechanism of action of teratogens are discussed with reference to some better known agents Presently regulatory authorities prefer whole animal studies in predictive safety evaluation of substances to which a pregnant woman may be exposed Tests are conducted over one or more generations and are designed to study the influence of test compounds upon general reproductive performance fertility fetal development and perinatal and postnatal behaviour Experiments are designed to permit compounds to be tested under conditions resembling expected human exposure Small rodents and rabbits are preferred species on account of their convenience as laboratory animals and the available knowledge regarding their reproductive behaviour fetal development and known sensitivity to human teratogens

Safety Evaluation of Biotechnologically-derived Pharmaceuticals
Susan A. Griffiths, C. Lumley, 2012-12-06 Considerable investment has been made by both pharmaceutical and biotechnology companies in pharmaceutical products of biotechnology However because relatively few of these products have been marketed lack of relevant experience means that uncertainty still surrounds the most appropriate strategy for their safety evaluation The 13th CMR International Workshop held in February 1997 provided the opportunity for regulatory authority and industry experts from Europe Japan and the USA to share their experiences of designing safety evaluation programmes for specific product classes colony stimulating factors growth factors hormones interferons interleukins monoclonal antibodies for therapeutic use and gene therapy products Participants worked together to recommend those studies that should be considered for such safety evaluation and those that may be unnecessary These recommendations subsequently made a valuable contribution to the ICH guideline Safety Studies for Biotechnological Products which was finalised at ICH 4 in Brussels in July 1997 The Workshop proceedings not only describe the recommendations but also provide the reader with
