checkpoint blockade ICB therapies have emerged as powerful approaches to reinvigorate tumor infiltrating T cells demonstrating considerable promise in clinical outcomes However challenges persist particularly the limited in vivo persistence of adoptively transferred T cells and the variable patient response rates to ICB therapy Key barriers include T cell exhaustion and the immunosuppressive milieu of the tumor microenvironment Consequently a deep understanding of functional modulation of these immune subsets is urgently needed to enhance the efficacy and safety of various T cell therapies such as Tumor infiltrating T lymphocytes TIL T T cell receptor engineered T cells TCR T and Chimeric antigen receptor T cells CAR T This Research Topic aims to explore and identify crucial targets and pathways for overcoming immune dysregulation in the tumor microenvironment We seek to advance our understanding of these complexities by discussing innovative techniques that could augment T cell antitumor functionality Contributions that unveil novel approaches or refine existing methods to boost the therapeutic potential of T cells in cancer treatment are particularly encouraged
