Pandolfino,2014-09-26 This issue devoted to Esophageal Function Testing highlights these tests that are complimentary to endoscopy and should be considered after endoscopy is performed In fact a prerequisite for performing many of these studies is a negative endoscopy and thus the endoscopist should be well informed regarding the indication and utility of these tests Additionally some of these newer technologies require endoscopy to be performed during the study as the placement or positioning of the measurement tool will require endoscopic landmarks or direct placement There have been major advances in most of these older techniques and new novel measurement paradigms have been created that allow for a more visual and accurate depiction of physiologic and anatomic data These technologies have evolved to be more akin to an imaging technique and thus the visual display and data acquisition is much more intuitive and easier to teach to trainees This review would be of the utmost importance to readers of GI Endoscopy Clinics **Endocrine Replacement Therapy in Clinical**
