Rapid Prototyping Casebook Julia A McDonald, Chris J Ryall, David I Wimpenny, 2001-06-22 Time compression technologies such as rapid prototyping and manufacturing offer enormous potential benefits Where time can be saved in the development of new or modified products expenditure can also be reduced Swifter development can also give a competitive edge to those using these techniques However there are a number of different systems and processes that can be used Ensuring that the most appropriate rapid prototyping and manufacturing technology is applied to a problem is vital to the success of a project The case studies compiled by the experienced team of the Warwick Manufacturing Group at the University of Warwick in the UK represent a range of different real experiences drawn from a variety of industries using a range of materials and processes

CONTENTS INCLUDE Overview of product design and development Computer aided design and rapid prototyping The introduction of CAD CAM in the ceramics industry Product design and development reverse engineering Reducing the risk of new product development by utilizing rapid prototyping technologies Stress analysis using rapid prototyping techniques Case studies in rapid prototyping and manufacturing techniques flow visualization using rapid prototype models Overview of utilizing bureau facilities Using bureau services Running an internal rapid prototyping bureau Overview of rapid casting techniques An alternative route to metal components for prototype and low volume production Rapid prototyping in pattern making and foundry applications Rapid prototyping enhancing product development at Parker Hannifin Cast tooling with rapid prototype patterns Overview of rapid tooling The role of rapid immediate production tooling IPT in new product development Rapid tooling cast resin and sprayed metal tooling

Rapid Prototyping Patri K. Venuvinod, Weiyin Ma, 2013-04-17 Since the dawn of civilization mankind has been engaged in the conception and manufacture of discrete products to serve the functional needs of local customers and the tools technology needed by other craftsmen In fact much of the progress in civilization can be attributed to progress in discrete product manufacture The functionality of a discrete object depends on two entities form and material composition For instance the aesthetic appearance of a sculpture depends upon its form whereas its durability depends upon the material composition An ideal manufacturing process is one that is able to automatically generate any form freeform in any material However unfortunately most traditional manufacturing processes are severely constrained on all these counts There are three basic ways of creating form conservative subtractive and additive In the first approach we take a material and apply the needed forces to deform it to the required shape without either adding or removing material i e we conserve material Many industrial processes such as forging casting sheet metal forming and extrusion emulate this approach A problem with many of these approaches is that they focus on form generation without explicitly providing any means for controlling material composition In fact even form is not created directly They merely duplicate the external form embedded in external tooling such as dies and molds and the internal form embedded in cores etc Till recently we have had to resort to the subtractive approach to create the form of the
