Understanding Protein Dynamics, Binding and Allostery for Drug Design Guang Hu, Pemra Doruker, Hongchun Li, Ebru Demet Akten, 2021-06-08 *From Protein Sequence to Motion to Function* Adam Damry, 2019 Protein dynamics are critical to the structure and function of proteins However due to the complexity they inherently bring to the protein design problem dynamics historically have not been considered in computational protein design CPD Herein we present meta MSD a new CPD methodology for the design of protein dynamics We applied our methodology to the design of a novel mode of conformational exchange in Streptococcal protein G domain B1 producing dynamic variants we termed DANCERS Predictions were validated by NMR characterization of selected DANCERS confirming that our meta MSD framework is suitable for the computational design of protein dynamics We then performed a thorough NMR characterization of the sequence determinants of dynamics in one DANCER isolating two mutations responsible for the novel dynamics this protein exhibits The first A34F is responsible for destabilizing the highly stable native G 1 conformation allowing the protein to sample other conformational states The second V39L mediates subtle interactions that stabilize the designed conformational trajectory in the context of the A34F mutation Together these results highlight the role of protein plasticity in the development of dynamics and the need for highly accurate computational tools to approach similar design problems Finally we present an NMR based characterization of structural dynamics in a family of related red fluorescent proteins RFPs and pinpoint regions of the RFP structure where dynamics correlate to RFP brightness This overview of the RFP dynamics function relationship

A. Subject access A-H* ,1994 On protein structure, function and modularity from an evolutionary perspective Robert Pilstål, 2018-05-23 We are compounded entities given life by a complex molecular machinery When studying these molecules we have to make sense of a diverse set of dynamical nanostructures with vast and intricate patterns of interactions Protein polymers is one of the major groups of building blocks of such nanostructures which fold up into more or less distinct three dimensional structures Due to their shape dynamics and chemical properties proteins are able to perform a plethora of specific functions essential to all known cellular lifeforms The connection between protein sequence translated into protein structure and in the continuation into protein function is well accepted but poorly understood Malfunction in the process of

protein folding is known to be implicated in natural aging cancer and degenerative diseases such as Alzheimer s Protein folds are described hierarchically by structural ontologies such as SCOP CATH and Pfam all which has yet to succeed in deciphering the natural language of protein function These paradigmatic views centered on protein structure fail to describe more mutable entities such as intrinsically disordered proteins IDPs which lack a clear defined structure As of 2012 about two thirds of cancer patients was predicted to survive past 5 years of diagnosis Despite this about a third do not survive and numerous of successfully treated patients suffer from secondary conditions due to chemotherapy surgery and the like In order to handle cancer more efficiently we have to better understand the underlying molecular mechanisms Elusive to standard methods of investigation IDPs have a central role in pathology dysfunction in IDPs are key factors in cellular system failures such as cancer as many IDPs are hub regulators for major cell functions These IDPs carry short conserved functional boxes that are not described by known ontologies which suggests the existence of a smaller entity In an investigation of a pair of such boxes of c MYC a plausible structural model of its interacting with Pin1 emerged but such a model still leaves the observer with a puzzle of understanding the actual function of that interaction If the protein is represented as a graph and modeled as the interaction patterns instead of as a structural entity another picture emerges As a graph there is a parable from that of the boxes of IDPs to that of sectors of allosterically connected residues and the theory of foldons and folding units Such a description is also useful in deciphering the implications of specific mutations In order to render a functional description feasible for both structured and disordered proteins there is a need of a model separate from form and structure Realized as protein primes patterns of interaction which has a specific function that can be defined as prime interactions and context With function defined as interactions it might be possible that the discussion of proteins and their mechanisms is thereby simplified to the point rendering protein structural determination merely supplementary to understanding protein function

proteinkedjan mellan besläktade arter som finns lagrade i databaser detta visar snabbt via en tverksanalys och grafteori vilka delar av proteinet som är centrala och kopplade till varandra av en dyndighet för artens fortlevnad. Påvisar evolutionen oss att först proteinfunktioner via modeller baserade på proteinernas interaktioner snarare än deras struktur. Samma modeller kan nyttjas för att först dynamiska förlopp och skillnader mellan normala och patologiska varianter av proteiner. Mutationer kan uppstå i vår arvsmassa som kan leda till sjukdom. Genom analys av proteinernas kopplingsnätverk i grafmodellerna kan man bättre förstå vilka mutationer som är farligare än andra. Dessutom har det visat sig att en sådan representation kan ge bättre förstelse för den normala funktionen hos ett protein än vad en proteinstruktur kan. Här introduceras även konceptet proteinprimär vilket är en abstrakt representation av proteiner centrerad på deras interaktiva mönster snarare än på partikulär form och struktur. Det är en förhoppning att en sådan representation skall förklara diskussionen anbelangande proteinfunktioner till den grad att strukturbestämelse av proteiner som är en mycket kostsam och tidskrävande process till viss mån kan anses vara sekundär i betydelse jämfört med funktionellt modellerande baserat på evolutionära data extraherade ur våra
