Chenot,E. Oñate,2012-12-06 The physical modelling of metal forming processes has been widely used both in University and in Industry for many years Relatively simple numerical models such as the Slab Method and the Upper Bound Method were first used

and many such models are implemented in the industry for practical design or regulation of forming processes These are also under investigation in the University mainly for treat models ments which require low cost calculations or very fast answers for on line integration More recently sophisticated numerical methods have been used for the simulation of metal flow during forming operations Since the early works in 1973 and 1974 mainly in U K and U S A the applications of the finite element method to metal processing have been developed in many laboratories all over the world Now the numerical approach seems to be widely re cognized as a powerful tool for comprehension oriented studies for predic ting the main technological parameters and for the design and the optlmi zation of new forming sequences There is also a very recent trend for the introduction of physical laws in the thermo mechanical models in order to predict the local evolution of internal variable representing the micro structure of the metal To day more and more praticians of the Industry are asking for compu ter models for design of their forming processes
