Managing Uncertainty In Expert Systems:

Managing Uncertainty in Expert Systems David C. Knue, AIR FORCE INST OF TECH WRIGHT-PATTERSON AFB OH SCHOOL OF ENGINEERING., 1986 A study of using probability to manage uncertainty in expert systems is presented The study begins with a comprehensive summary of the literature on applying numeric techniques to manage uncertainty in expert systems In addition to probability fuzzy sets certainty factors and belief functions are addressed basic principles and rules of information combination for each technique are discussed The Lindley scoring rule argument for why probability is mathematically techniques is reviewed The issues why using probability is considered to be a hindrance to managing uncertainty in expert systems are also reviewed A simple expert system is developed using a state of the art expert system building tool called ALTERID ALTERID is unique in that it unifies logical and probabilistic inference This simple expert system is used to explore how probability theory can be used to manage the uncertainty in expert systems The simple ALTERID based expert system is also used to evaluate the aforementioned issues for using probability to manage uncertainty in expert systems Keywords artificial intelligence Bayes theorem decision analysis theses **Managing Uncertainty in Expert Systems** Jerzy W Grzymala-Busse, 1991-07-31

Methods and Applications of Intelligent Control S.G. Tzafestas, 2012-12-06 This book is concerned with Intelligent Control methods and applications The field of intelligent control has been expanded very much during the recent years and a solid body of theoretical and practical results are now available These results have been obtained through the synergetic fusion of concepts and techniques from a variety of fields such as automatic control systems science computer science neurophysiology and operational research Intelligent control systems have to perform anthropomorphic tasks fully autonomously or interactively with the human under known or unknown and uncertain environmental conditions Therefore the basic components of any intelligent control system include cognition perception learning sensing planning numeric and symbolic processing fault detection repair reaction and control action These components must be linked in a systematic synergetic and efficient way Predecessors of intelligent control are adaptive control self organizing control and learning control which are well documented in the literature Typical application examples of intelligent controls are intelligent robotic systems intelligent manufacturing systems intelligent medical systems and intelligent space teleoperators Intelligent controllers must employ both quantitative and qualitative information and must be able to cope with severe temporal and spatial variations in addition to the fundamental task of achieving the desired transient and steady state performance Of course the level of intelligence required in each particular application is a matter of discussion between the designers and users The current literature on intelligent control is increasing but the information is
