Rarefied Gas Dynamics 23rd International Symposium:

Rarefied Gas Dynamics Andrew D. Ketsdever, E.P. Munz, 2003-05-19 The papers in these proceedings were peer reviewed The RGD Symposia are highly interdisciplinary and encompass all aspects of rarefaction and non equilibrium phenomena in gases Rarefied flow phenomena include the mechanics and physics of low density gases and the analysis of flows which take place on a spatial scale comparable to the mean free path of a gas Topics covered include Kinetic theory and transport theory numerical methods including direct simulation Monte Carlo and molecular dynamics gas surface phenomena nano and microscale flows molecular beams atom and molecular optics clusters and aerosols external flows including space and vacuum technologies plume flows hypersonic flows molecular collision dynamics relaxation processes ionized gas flows physics of the space environment plasma processing experimental techniques diagnostics including laser induced fluorescence and electron beams applications With the increase in space activities and microfabrication capabilities new themes have emerged including rarefied hypersonic flows non equilibrium gases plasma processing nano and micro scale flows at relatively high pressures along with parallel and hybrid computational developments Because the RGD Symposia are recognized as the principle forum for the presentation of recent advances in this field it is a must for engineers and scientists in a variety of specialties Future Energy Conferences and Symposia, 1991 **Macroscopic Transport**

Equations for Rarefied Gas Flows Henning Struchtrup, 2006-06-15 The well known transport laws of Navier Stokes and Fourier fail for the simulation of processes on lengthscales in the order of the mean free path of a particle that is when the Knudsen number is not small enough Thus the proper simulation of flows in rarefied gases requires a more detailed description This book discusses classical and modern methods to derive macroscopic transport equations for rarefied gases from the Boltzmann equation for small and moderate Knudsen numbers i.e. at and above the Navier Stokes Fourier level The main methods discussed are the classical Chapman Enskog and Grad approaches as well as the new order of magnitude method which avoids the shortcomings of the classical methods but retains their benefits The relations between the various methods are carefully examined and the resulting equations are compared and tested for a variety of standard problems The book develops the topic starting from the basic description of an ideal gas over the derivation of the Boltzmann equation towards the various methods for deriving macroscopic transport equations and the test problems which include stability of the equations shock waves and Couette flow Proceedings of the International Symposium on Two-Phase Systems G.

Boltzmann Equation Sergej Rjasanow, Wolfgang Wagner, 2005-11-04 Stochastic numerical methods play an important role in large scale computations in the applied sciences The first goal of this book is to give a mathematical description of classical direct simulation Monte Carlo DSMC procedures for rarefied gases using the theory of Markov processes as a unifying framework The second goal is a systematic treatment of an extension of DSMC called stochastic weighted particle method This method includes several new features which are introduced for the purpose of variance reduction rare event simulation Rigorous convergence results as well as detailed numerical studies are presented **High Temperature**

Phenomena in Shock Waves Raymond Brun, 2012-01-24 The high temperatures generated in gases by shock waves give rise to physical and chemical phenomena such as molecular vibrational excitation dissociation ionization chemical reactions and inherently related radiation In continuum regime these processes start from the wave front so that generally the gaseous media behind shock waves may be in a thermodynamic and chemical non equilibrium state This book presents the state of knowledge of these phenomena Thus the thermodynamic properties of high temperature gases including the plasma state are described as well as the kinetics of the various chemical phenomena cited above Numerous results of measurement and computation of vibrational relaxation times dissociation and reaction rate constants are given and various ionization and radiative mechanisms and processes are presented The coupling between these different phenomena is taken into account as well as their interaction with the flow field Particular points such as the case of rarefied flows and the inside of the shock wave itself are also examined Examples of specific non equilibrium flows are given generally corresponding to those encountered during spatial missions or in shock tube experiments **Energy Research Abstracts** ,1990 **Energy**

Colin, 2019-10-28 The last two decades have witnessed a rapid development of microelectromechanical systems MEMS involving gas microflows in various technical fields Gas microflows can for example be observed in microheat exchangers designed for chemical applications or for cooling of electronic components in fluidic microactuators developed for active flow control purposes in micronozzles used for the micropropulsion of nano and picosats in microgas chromatographs analyzers or separators in vacuum generators and in Knudsen micropumps as well as in some organs on a chip such as artificial lungs These flows are rarefied due to the small MEMS dimensions and the rarefaction can be increased by low pressure conditions The flows relate to the slip flow transition or free molecular regimes and can involve monatomic or polyatomic gases and gas mixtures Hydrodynamics and heat and mass transfer are strongly impacted by rarefaction effects and temperature driven microflows offer new opportunities for designing original MEMS for gas pumping or separation Accordingly this Special

Issue seeks to showcase research papers short communications and review articles that focus on novel theoretical and numerical models or data as well as on new experimental results and technics for improving knowledge on heat and mass transfer in gas microflows Papers dealing with the development of original gas MEMS are also welcome
