H. Storey, 2011-02-17 This 1970 book the authors derive the equations describing equilibria in different types of system and outline the effect of variation of the parameters of the system on the equilibrium composition by using equilibrium calculations in high temperature high pressure processes in rocketry and in explosives technology Phase Equilibria in Chemical Engineering Stanley M. Walas, 2013-10-22 Phase Equilibria in Chemical Engineering is devoted to the thermodynamic basis and practical aspects of the calculation of equilibrium conditions of multiple phases that are pertinent to chemical engineering processes Efforts have been made throughout the book to provide guidance to adequate theory and practice The book begins with a long chapter on equations of state since it is intimately bound up with the development of thermodynamics Following material on basic thermodynamics and nonidealities in terms of fugacities and activities individual chapters are devoted to equilibria primarily between pairs of phases A few topics that do not fit into these categories and for which the state of the art is not yet developed quantitatively have been relegated to a separate chapter The chapter on chemical equilibria is pertinent since many processes involve simultaneous chemical and phase equilibria Also included are chapters on the evaluation of enthalpy and entropy changes of nonideal substances and mixtures and on experimental methods This book is intended as a reference and self study as well as

a textbook either for full courses in phase equilibria or as a supplement to related courses in the chemical engineering curriculum Practicing engineers concerned with separation technology and process design also may find the book useful

Chemical Equilibrium William B. Guenther, 1975 *Chemical Equilibrium* William Guenther, 2012-12-06 The present work is designed to provide a practical introduction to aqueous equilibrium phenomena for both students and research workers in chemistry biochemistry geochemistry and interdisciplinary environmental fields The pedagogical strategy I have adopted makes heavy use of detailed examples of problem solving from real cases arising both in laboratory research and in the study of systems occurring in nature The procedure starts with mathematically complete equations that will provide valid solutions of equilibrium problems instead of the traditional approach through approximate concentrations and idealized infinite dilution assumptions There is repeated emphasis on the use of corrected conditional equilibrium constants and on the checking of numerical results by substitution in complete equations and or against graphs of species distributions Graphical methods of calculation and display are used extensively because of their value in clarifying equilibria and in leading one quickly to valid numerical approximations The coverage of solution equilibrium phenomena is not however exhaustively comprehensive Rather I have chosen to offer fundamental and rigorous examinations of homogeneous step equilibria and their interactions with solubility and redox equilibria Many examples are worked out in detail to demonstrate the use of equilibrium calculations and diagrams in various fields of investigation
