Modeling and Computational Methods for Kinetic Equations Pierre Degond, Lorenzo Pareschi, Giovanni Russo, 2012-12-06

In recent years kinetic theory has developed in many areas of the physical sciences and engineering and has extended the borders of its traditional fields of application. New applications in traffic flow engineering, granular media modeling and polymer and phase transition physics have resulted in new numerical algorithms which depart from traditional stochastic Monte Carlo methods. This monograph is a self-contained presentation of such recently developed aspects of kinetic theory as well as a comprehensive account of the fundamentals of the theory. Emphasizing modeling techniques and numerical methods, the book provides a unified treatment of kinetic equations not found in more focused theoretical or applied works. The book is divided into two parts. Part I is devoted to the most fundamental kinetic model, the Boltzmann equation of rarefied gas dynamics. Additionally, widely used numerical methods for the discretization of the Boltzmann equation are reviewed: the Monte Carlo method, spectral methods and finite difference methods. Part II considers specific applications: plasma kinetic modeling using the Landau-Fokker-Planck equations, traffic flow modeling, granular media modeling, quantum kinetic modeling and coagulation-fragmentation problems. *Modeling and Computational Methods of Kinetic Equations* will be accessible to readers working in different communities where kinetic theory is important: graduate students, researchers and practitioners in mathematical physics, applied mathematics and various branches of engineering. The work may be used for self-study as a reference text or in graduate level courses in kinetic theory and its applications.

Modern Mathematical Methods in Transport Theory Greenberg, Polewczak, 2013-11-22. The Eleventh International Transport Theory Conference and Symposium in honor of the sixty-fifth birthday of Kenneth Case and the sixtieth birthday of Paul Zweifel was held in Blacksburg, Virginia during May 22-26, 1989 on the campus of Virginia Polytechnic Institute and State University, Virginia Tech. This volume consists of a selection of the invited papers delivered at the Conference and represents a cross-section of the research currently being carried out in the field of transport theory. The volume is divided into two sections. The Symposium lectures are intended each to summarize an important aspect of transport theory as well as to present timely new results of the author's research interest. The Conference lectures are contributions of each author on his current research. As has been the custom in this series of conferences, each lecturer was invited to participate by the organizing committee of the Conference. W. Greenberg, Virginia Tech, chairman; V. Boffi, Università di Firenze; N. Corngold, California Institute of Technology; B. Ganapol, University of Arizona; N. McCormick, University of Washington; P. Nelson, Texas Tech; G. Pomraning, University of California, Los Angeles. The Eleventh International Transport Theory Conference was funded by generous contributions from

Science Applications International Corporation R Beyster president and from Virginia Polytechnic Institute and State University Conference participants and we believe researchers in this and related areas are indebted to these organizations We would like to thank Lamberto Rondoni in the graduate program at Virginia Tech for proofreading manuscripts of all the Italian contributors **Mathematical Methods in the Kinetic Theory** Mathematisches Forschungsinstitut,1985

Trails in Kinetic Theory Giacomo Albi,Sara Merino-Aceituno,Alessia Nota,Mattia Zanella,2021-07-15 In recent decades kinetic theory originally developed as a field of mathematical physics has emerged as one of the most prominent fields of modern mathematics In recent years there has been an explosion of applications of kinetic theory to other areas of research such as biology and social sciences This book collects lecture notes and recent advances in the field of kinetic theory of lecturers and speakers of the School Trails in Kinetic Theory Foundational Aspects and Numerical Methods hosted at Hausdorff Institute for Mathematics HIM of Bonn Germany 2019 during the Junior Trimester Program Kinetic Theory Focusing on fundamental questions in both theoretical and numerical aspects it also presents a broad view of related problems in socioeconomic sciences pedestrian dynamics and traffic flow management Mathematical Methods in Particle Transport Theory Michael Maurice Rudolph Williams,1971 *Modeling Complex Living Systems* N. Bellomo,2008 Develops different mathematical methods and tools to model living systems This book presents material that can be used in such real world applications as immunology transportation engineering and economics It is of interest to those involved in modeling complex social systems and living matter in general **Kinetic Theory** R.L. Liboff,2006-03-30 This book goes beyond the scope of other works in the field with its thorough treatment of applications in a wide variety of disciplines The third edition features a new section on constants of motion and symmetry and a new appendix on the Lorentz Legendre expansion

Kinetic Theory of Gases and Plasmas PPJM Schram,2012-12-06 Kinetic theory is the link between the non equilibrium statistical mechanics of many particle systems and macroscopic or phenomenological physics Therefore much attention is paid in this book both to the derivation of kinetic equations with their limitations and generalizations on the one hand and to the use of kinetic theory for the description of physical phenomena and the calculation of transport coefficients on the other hand The book is meant for researchers in the field graduate students and advanced undergraduate students At the end of each chapter a section of exercises is added not only for the purpose of providing the reader with the opportunity to test his understanding of the theory and his ability to apply it but also to complete the chapter with relevant additions and examples that otherwise would have overburdened the main text of the preceding sections The author is indebted to the physicists who taught him Statistical Mechanics Kinetic Theory Plasma Physics and Fluid Mechanics I gratefully acknowledge the fact that much of the inspiration without which this book would not have been possible originated from what I learned from several outstanding teachers In particular I want to mention the late Prof dr H C Brinkman who directed my first steps in the field of theoretical plasma physics my thesis advisor Prof dr N G Van Kampen and Prof dr A N Kaufman whose course on Non

Boundary Value Problems in Abstract Kinetic Theory W. Greenberg, 2013-12-14 This monograph is intended to be a reasonably self contained and fairly complete exposition of rigorous results in abstract kinetic theory Throughout abstract kinetic equations refer to an abstract formulation of equations which describe transport of particles momentum energy or indeed any transportable physical quantity These include the equations of traditional neutron transport theory radiative transfer and rarefied gas dynamics as well as a plethora of additional applications in various areas of physics chemistry biology and engineering The mathematical problems addressed within the monograph deal with existence and uniqueness of solutions of initial boundary value problems as well as questions of positivity continuity growth stability explicit representation of solutions and equivalence of various formulations of the transport equations under consideration The reader is assumed to have a certain familiarity with elementary aspects of functional analysis especially basic semigroup theory and an effort is made to outline any more specialized topics as they are introduced Over the past several years there has been substantial progress in developing an abstract mathematical framework for treating linear transport problems The benefits of such an abstract theory are twofold i a mathematically rigorous basis has been established for a variety of problems which were traditionally treated by somewhat heuristic distribution theory methods and ii the results obtained are applicable to a great variety of disparate kinetic processes Thus numerous different systems of integrodifferential equations which model a variety of kinetic processes are themselves modelled by an abstract operator equation on a Hilbert or Banach space

Transport Phenomena and Kinetic Theory Carlo Cercignani, Ester Gabetta, 2007-12-03 The study of kinetic equations related to gases semiconductors photons traffic flow and other systems has developed rapidly in recent years because of its role as a mathematical tool in areas such as engineering meteorology biology chemistry materials science nanotechnology and pharmacy Written by leading specialists in their respective fields this book presents an overview of recent developments in the field of mathematical kinetic theory with a focus on modeling complex systems emphasizing both mathematical properties and their physical meaning Transport Phenomena and Kinetic Theory is an excellent self study reference for graduate students researchers and practitioners working in pure and applied mathematics mathematical physics and engineering The work may be used in courses or seminars on selected topics in transport phenomena or applications of the Boltzmann equation

Kinetic Theory of Gases in Shear Flows Vicente Garzó, A. Santos, 2013-03-09 The kinetic theory of gases as we know it dates to the paper of Boltzmann in 1872 The justification and context of this equation has been clarified over the past half century to the extent that it comprises one of the most complete examples of many body analyses exhibiting the contraction from a microscopic to

a mesoscopic description The primary result is that the Boltzmann equation applies to dilute gases with short ranged interatomic forces on space and time scales large compared to the corresponding atomic scales Otherwise there is no a priori limitation on the state of the system This means it should be applicable even to systems driven very far from its equilibrium state However in spite of the physical simplicity of the Boltzmann equation its mathematical complexity has masked its content except for states near equilibrium While the latter are very important and the Boltzmann equation has been a resounding success in this case the full potential of the Boltzmann equation to describe more general nonequilibrium states remains unfulfilled An important exception was a study by Ikenberry and Truesdell in 1956 for a gas of Maxwell molecules undergoing shear flow They provided a formally exact solution to the moment hierarchy that is valid for arbitrarily large shear rates It was the first example of a fundamental description of rheology far from equilibrium albeit for an unrealistic system With rare exceptions significant progress on nonequilibrium states was made only 20-30 years later **An**
