Abstract: We have developed an optimal scheduling method for raw material operations aiming the raw materials cost reduction. In this paper, we report optimization approaches to minimize the cost of ore blending in steel works.

The ore blending problem is to make schedules for the purpose of cost minimization under several constraints such as the stock in yards, ingredients in sintered ore. When formulating as a mathematical model, nonlinearity exists in this problem and make it complicated. However, this problem has characteristic that becomes a linear problem by fixing several key variables as constants. To overcome the nonlinearity, we developed our original Hybrid model that was a combination of Particle Swarm Optimization (PSO) and Linear Programming method (LP). We applied PSO to search the best way of fixing key variables, and obtained blending schedules by solving LPs. Our Hybrid model searched wide area effectively, and derived the solution within 2 minutes. Numerical experiments indicated a cost reduction of secondary materials by 13%.

Keywords: ore blending; mathematical programming; optimization; linear programming; meta heuristics; particle swarm optimization; multi-point search method.

Mathematical Programming Methods for Geographers and Planners James Killen, 2021-11-30 Originally published in 1983 this was the first text to offer an in depth treatment of mathematical programming methods explained from first principles It considers all the major programming techniques and fully explains key terms illustrates theories with detailed examples and shows how the various skills are applied in practice It will be invaluable in both the academic world and to policy formulators and planners who make extensive use of the methods described

Methods and Models in Mathematical Programming S. A. MirHassani, F. Hooshmand, 2019-12-09 This book focuses on mathematical modeling describes the process of constructing and evaluating models discusses the challenges and delicacies of the modeling process and explicitly outlines the required rules and regulations so that the reader will be able to generalize and reuse concepts in other problems by relying on mathematical logic Undergraduate and postgraduate students of different academic disciplines would find this book a suitable option preparing them for jobs and research fields requiring modeling techniques Furthermore this book can be used as a reference book for experts and practitioners requiring advanced skills of model building in their jobs

Mathematical Programming Methods in Structural Plasticity D. Lloyd Smith, 2014-05-04 Civil engineering structures tend to be fabricated from materials that respond elastically at normal levels of loading Most such materials however would exhibit a marked and ductile inelasticity if the structure were overloaded by accident or by some improbable but naturally occurring phenomenon Indeed the very presence of such ductility constitutes an important safety provision for large scale constructions where human life is at risk In the comprehensive evaluation of safety in structural design it is therefore unrealistic not to consider the effects of ductility This book sets out to show that the bringing together of the theory and methods of mathematical programming with the mathematical theory of plasticity furnishes a model which has a unifying theoretical nature and is entirely representative of observed structural behaviour The contents of the book provide a review of the relevant aspects of mathematical programming and plasticity theory together with a detailed presentation of the most interesting and potentially useful applications in both framed and continuum structures ultimate strength and elastoplastic deformability shakedown and practical upper bounds on deformation measures evolutive dynamic response large displacements and instability stochastic and fuzzy programming for representing uncertainty in ultimate strength calculations Besides providing a ready fund of computational algorithms mathematical

Marktoberdorf Summer School outstanding scientists lectured on mathematical programming methods. The lectures centred around logical and functional calculi for the specification refinement verification of programs and program systems. Some extremely remarkable examples were given. Looking at these examples it becomes clear that proper research and teaching in the area of program methodology should always show its value by being applied at least to small examples or case studies. It is one of the problems of computing science that examples and case studies have to be short and small to be presentable in lectures and papers of moderate size. However, even small examples can tell a lot about the tractability and adequacy of methods and being able to treat small examples does at least prove that the method can be applied in modest ways. Furthermore, it demonstrates to some extent the notational and calculational overhead of applying formal methods.

This state of the art survey provides readers with a capsule look into the existing methods and their characteristics and applicability to analysis of fuzzy and possibilistic programming problems. To realize practical fuzzy modelling we present solutions for real world problems including production, manufacturing, transportation, assignment, game, environmental management, resource allocation, project investment, banking, finance and agricultural economics. To improve flexibility and robustness of fuzzy mathematical programming techniques we also present our expert decision making support system IFLP which considers and solves all possibilities of a specific domain of fuzzy linear programming problems. Basic fuzzy set theories, membership functions, fuzzy decisions, operators and fuzzy arithmetic are introduced with simple numerical examples in an easy to read and easy to follow manner. An updated bibliographical listing of 60 books, monographs or conference proceedings and about 300 selected papers, reports or theses is presented in the end of this study.
