Real-World Problems for Secondary School Mathematics Students Juergen Maasz, John O'Donoghue, 2011-10-30

This is a book full of ideas for introducing real world problems into mathematics classrooms and assisting teachers and students to benefit from the experience. Taken as a whole, these contributions provide a rich resource for mathematics teachers and their students that is readily available in a single volume. Nowadays there is a universal emphasis on teaching for understanding, motivating students to learn mathematics and using real world problems to improve the mathematics experience of school students. However, using real world problems in mathematics classrooms places extra demands on teachers in terms of extra mathematical knowledge, e.g. knowledge of the area of applications and pedagogical knowledge. Care must also be taken to avoid overly complex situations and applications. Papers in this collection offer a practical perspective on these issues and more. While many papers offer specific, well-worked-out lesson type ideas, others concentrate on the teacher knowledge needed to introduce real world applications of mathematics into the classroom. We are confident that mathematics teachers who read the book will find a myriad of ways to introduce the material into their classrooms, whether in ways suggested by the contributing authors or in their own ways, perhaps through mini projects or extended projects or practical sessions or enquiry based learning. We are happy if they do. This book is written for mathematics classroom teachers and their students, mathematics teacher educators and mathematics teachers in training at pre-service and in-service phases of their careers.

Adults' Mathematical Thinking and Emotions Jeff Evans, 2000. The crisis around teaching and learning of mathematics and its use in everyday life and work relate to a number of issues. These include the doubtful transferability of school maths to real life contexts, the declining participation in A level and higher education maths courses, the apparent exclusion of some groups such as women, and the aversion of many people to maths. This book addresses these issues by considering a number of key problems in maths education and numeracy differences among social groups, especially those related to gender and social class, the inseparability of cognition and emotion in mathematical activity, the understanding of maths anxiety in traditional psychological, psychoanalytical and feminist theories, how adults numerate, thinking and performance must be understood in context. The author's findings have practical applications in education and training, such as clarifying problems of the transfer of learning and of countering maths anxiety.
