Mathematics And Culture:

Cognition in Practice Jean Lave, 1988-07-29 Most previous research on human cognition has focused on problem solving and has confined its investigations to the laboratory As a result it has been difficult to account for complex mental processes and their place in culture and history In this startling indeed disorienting study Jean Lave moves the analysis of one particular form of cognitive activity arithmetic problem solving out of the laboratory into the domain of everyday life In so doing she shows how mathematics in the real world like all thinking is shaped by the dynamic encounter between the culturally endowed mind and its total context a subtle interaction that shapes 1 Both the human subject and the world within which it acts The study is focused on mundane daily activities such as grocery shopping for best buys in the supermarket dieting and so on Innovative in its method fascinating in its findings the research is above all significant in its theoretical contributions Have offers a cogent critique of conventional cognitive theory turning for an alternative to recent social theory and weaving a compelling synthesis from elements of culture theory theories of practice and Marxist discourse The result is a new way of understanding human thought processes a vision of cognition as the dialectic between persons acting and the settings in which their activity is constituted The book will appeal to anthropologists for its novel theory of the relation of cognition to culture and context to cognitive scientists and educational theorists and to the plain folks who form its subject and who will recognize themselves in it a rare accomplishment in the modern social sciences

Mathematical Enculturation Alan Bishop,2012-12-06

Mathematics is in the unenviable position of being simultaneously one of the most important school subjects for today s children to study and one of the least well understood Its reputation is awe inspiring Everybody knows how important it is and everybody knows that they have to study it But few people feel comfortable with it so much so that it is socially quite acceptable in many countries to confess ignorance about it to brag about one s incompetence at doing it and even to claim that one is mathophobic So are teachers around the world being apparently legal sadists by inflicting mental pain on their charges Or is it that their pupils are all masochists enjoying the thrill of self inflicted mental torture More seriously do we really know what the reasons are for the mathematical activity which goes on in schools Do we really have confidence in our criteria for judging what s important and what isn t Do we really know what we should be doing These basic questions become even more important when considered in the context of two growing problem areas The first is a concern felt in many countries about the direction which mathematics education should take in the face of the increasing presence of computers and calculator related technology in society
