**Advanced Mathematics for Engineers and Scientists with Worked Examples** Shefiu Zakariyah, 2024-11-25

Advanced Mathematics for Engineers and Scientists with Worked Examples covers core to advanced topics in mathematics required for science and engineering disciplines. It is primarily designed to provide a comprehensive straightforward and step by step presentation of mathematical concepts to engineers, scientists and general readers. It moves from simple to challenging areas with carefully tailored worked examples also of different degrees of challenge. Mathematical concepts are deliberately linked with appropriate engineering applications to reinforce their value and are aligned with topics taught in major overseas curriculums. This book is written primarily for students at levels 3 and 4 typically in the early stages of a degree in engineering or a related discipline or for those undertaking foundation access, Higher National Certificate, HND, International Foundation Year (IFY) and International Year One (IYO) courses with math modules. It is organised into four main parts: Part I Trigonometry, Part II Advanced Mathematics, Part III Matrices and Vectors, Part IV Calculus. Each of the above four parts is divided into two or more chapters and each chapter can be used as a stand alone guide with no prior knowledge assumed. Additional exercises and resources for each chapter can be found online. To access this supplementary content, please go to [www.dszak.com](http://www.dszak.com).

**Mathematics for Natural Scientists II** Lev Kantorovich, 2024-03-23

This textbook is the second in a series; the first covered fundamentals and basics, seeks to make its material accessible to physics students. Physics engineering can be greatly enhanced by knowledge of advanced mathematical techniques, but the math-specific jargon and laborious proofs can be off-putting to students not well-versed in abstract math. This book uses examples and proofs designed to be clear and convincing from the context of physics, as well as providing a large number of both solved and unsolved problems in each chapter. This is the second edition and it has been significantly revised and enlarged with Chapters 1 on linear algebra and 2 on the calculus of complex numbers and functions having been particularly expanded. The enhanced topics throughout the book include vector spaces, general non-Hermitian including normal and defective matrices and their right-left eigenvectors, values, Jordan form, pseudoinverse, linear systems of differential equations, Gaussian elimination, fundamental theorem of algebra, convergence of a Fourier series and Gibbs-Wilbraham phenomenon, careful derivation of the Fourier integral and of the inverse Laplace transform. New material has been added on many physics topics meant to illustrate the maths, such as 3D rotation, properties of the free electron gas, van Hove singularities and methods for both solving PDEs with a Fourier transform and calculating the width of a domain wall in a ferromagnet, to mention just a few. This textbook should prove invaluable to all of those with an interest in physics engineering who have previously experienced difficulty processing the math involved.
