Decadal Survey on Astronomy and Astrophysics 2020 (Astro2020), 2023 Quantitative Systems Biology for Engineering Organisms and Pathways Hilal Taymaz-Nikerel, Alvaro R. Lara, 2016-05-27 Studying organisms as a whole for potential metabolic ally engineering of organisms for production of bio chemicals is essential for industrial biotechnology To this end integrative analysis of different omics measurements transcriptomics proteomics metabolomics fluxomics provides invaluable information Combination of experimental top down and bottom up approaches with powerful analytical tools techniques and mathematical modeling namely quantitative systems biology currently making the state of art of this discipline is the only practice that would improve our understanding for the purpose The use of high throughput technologies induced the required development of many bioinformatics tools and mathematical methods for the integration of obtained data Such research is significant since compiling information from different levels of a living system and connecting them is not an easy task In particular construction of dynamic models for product improvement has been one of the goals of many research groups In this Research Topic we summarize and bring a general review of the most recent and relevant contributions in quantitative systems biology applied in metabolic modeling perspective We want to make special emphasis on the techniques that can be widely implemented in regular scientific laboratories and in those works that include

theoretical presentations With this Research Topic we discuss the importance of applying systems biology approaches for finding metabolic engineering targets for the efficient production of the desired biochemical integrating information from genomes and networks to industrial production Examples and perspectives in the design of new industrially relevant chemicals e g increased titer productivity yield of bio chemicals are welcome Addition to the founded examples potential new techniques that would frontier the research will be part of this topic The significance of multi omics approaches to understand uncover the pathogenesis mechanisms of metabolic diseases is also one of the main topics

Web Service Mining George Zheng, Athman Bouguettaya, 2010-06-14 The new computing environment enabled by advances in service oriented architectures mashups and cloud computing will consist of service spaces comprising data applications infrastructure resources distributed over the Web This environment embraces a holistic paradigm in which users services and resources establish on demand interactions possibly in real time to realise useful experiences Such interactions obtain relevant services that are targeted to the time and place of the user requesting the service and to the device used to access it The benefit of such environment originates from the added value generated by the possible interactions in a large scale rather than by the capabilities of its individual components separately This offers tremendous automation opportunities in a variety of application domains including execution of forecasting of tasks travel support intelligent information gathering and analysis environment monitoring healthcare e business community based systems e science and e government A key feature of this environment is the ability to dynamically compose services to realise user

tasks While recent advances in service discovery composition and Semantic Web technologies contribute necessary first steps to facilitate this task the benefits of composition are still limited to take advantages of large scale ubiquitous environments The main stream composition techniques and technologies rely on human understanding and manual programming to compose and aggregate services Recent advances improve composition by leveraging search technologies and flow based composition languages as in mashups and process centric service composition
