Diekmann,J. A. P. Heesterbeek,2000-04-07 Mathematical Epidemiology of Infectious Diseases Model Building Analysis and Interpretation O Diekmann University of Utrecht The Netherlands J A P Heesterbeek Centre for Biometry Wageningen The Netherlands The mathematical modelling of epidemics in populations is a vast and important area of study It is about translating biological assumptions into mathematics about mathematical analysis aided by interpretation and about obtaining insight into epidemic phenomena when translating mathematical results back into population biology Model assumptions are formulated in terms of usually stochastic behaviour of individuals and then the resulting phenomena at the population level are unravelled Conceptual clarity is attained assumptions are stated clearly hidden working hypotheses are attained and mechanistic links between different observables are exposed Features Model construction analysis and interpretation receive detailed attention Uniquely covers both deterministic and stochastic viewpoints Examples of applications given throughout Extensive coverage of the latest research into the mathematical modelling of epidemics of infectious diseases Provides a solid foundation of modelling skills The reader will learn to translate model analyse and interpret with the help of the numerous exercises In literally working through this text the reader acquires modelling skills that are also valuable outside of epidemiology certainly within population dynamics but even beyond that In addition the reader receives training in mathematical argumentation The text is aimed at applied mathematicians with an interest in population biology and epidemiology at theoretical biologists and epidemiologists Previous exposure to epidemic concepts is not required as all background information is given The book is primarily aimed at self study and ideally suited for small discussion groups or for use as a course text **Mathematical Understanding of Infectious Disease Dynamics** Stefan Ma,Yingcun Xia,2009 An Original book with a comprehensive collection of many significant topics of the frontiers in applied presentation of many epidemic models with many real life examples presents an integration of interesting ideas from the well mixed fields of statistics and mathematics A valuable resource for researchers in wide range of disciplines to solve problems of practical interest **Epidemic Models** Denis Mollison,1995-07-13 Surveys the state of epidemic modelling resulting from the NATO

Advanced Workshop at the Newton Institute in 1993 **Infectious Disease Modeling** Xinzhi Liu,Peter Stechlinski,2017-02-25 This volume presents infectious diseases modeled mathematically taking seasonality and changes in population behavior into account using a switched and hybrid systems framework The scope of coverage includes background on mathematical epidemiology including classical formulations and results a motivation for seasonal effects and changes in population behavior an investigation into term time forced epidemic models with switching parameters and a detailed account of several different control strategies The main goal is to study these models theoretically and to establish conditions under which eradication or persistence of the disease is guaranteed In doing so the long term behavior of the models is determined through mathematical techniques from switched systems theory Numerical simulations are also given to augment and illustrate the theoretical results and to help study the efficacy of the control schemes *Mathematical Statistics Theory and Applications* ,2020-05-18 No detailed description available for Mathematical Statistics Theory and Applications A Quest Towards a Mathematical Theory of Living Systems Nicola Bellomo,Abdelghani Bellouquid,Livio Gibelli,Nisrine Outada,2017-07-13 This monograph aims to lay the groundwork for the design of a unified mathematical approach to the modeling and analysis of large complex systems composed of interacting living things Drawing on twenty years of research in various scientific fields it explores how mathematical kinetic theory and evolutionary game theory can be used to understand the complex interplay between mathematical sciences and the dynamics of living systems The authors hope this will contribute to the development of new tools and strategies if not a new mathematical theory The first chapter discusses the main features of living systems and outlines a strategy for their modeling The following chapters then explore some of the methods needed to potentially achieve this in practice Chapter Two provides a brief introduction to the mathematical kinetic theory of classical particles with special emphasis on the Boltzmann equation the Enskog equation mean field models and Monte Carlo methods are also briefly covered Chapter Three uses concepts from evolutionary game theory to derive mathematical structures that are able to capture the complexity features of interactions within living systems The book then shifts to exploring the relevant applications of these methods that can potentially be used to derive specific usable models The modeling of social systems in various contexts is the subject of Chapter Five and an overview of modeling crowd dynamics is given in Chapter Six demonstrating how this approach can be used to model the dynamics of multicellular systems The final chapter considers some additional applications before presenting an overview of open problems The authors then offer their own speculations on the conceptual paths that may lead to a mathematical theory of living systems hoping to motivate future research activity in the field A truly unique contribution to the existing literature A Quest Toward a Mathematical Theory of Living Systems is an important book that will no doubt have a significant influence on the future directions of the field It will be of interest to mathematical biologists systems biologists biophysicists and other researchers working on understanding the complexities of living systems *Math and Bio 2010* Lynn Arthur Steen,2005
