Mathematical Problems Of Tomography:

Mathematical Problems of Tomography Izrail' Moiseevich Gel'fand, Semen Grigor'evich Gindikin, 1990 As early as 1917 Radon derived an explicit formula for the reconstruction of a function on the plane given its integrals over all lines In the late 1960s the first applications of the Radon formula appeared in radio astronomy and then in electron micrography The use of the Radon formula for constructing tomograms made possible by the advent of the computer saw its first use in clinical medicine in 1970 and earned its developers the Nobel Prize in medicine Applied Mathematical Modelling of Engineering Problems N.V. Hritonenko, Yuri P. Yatsenko, 2013-04-17 The subject of the book is the know how of applied mathematical modelling how to construct specific models and adjust them to a new engineering environment or more precise realistic assumptions how to analyze models for the purpose of investigating real life phenomena and how the models can extend our knowledge about a specific engineering process Two major sources of the book are the stock of classic models and the authors wide experience in the field The book provides a theoretical background to guide the development of practical models and their investigation It considers general modelling techniques explains basic underlying physical laws and shows how to transform them into a set of mathematical equations The emphasis is placed on common features of the modelling process in various applications as well as on complications and generalizations of models The book covers a variety of applications mechanical acoustical physical and electrical water transportation and contamination processes bioengineering and population control production systems and technical equipment renovation Mathematical tools include partial and ordinary differential equations difference and integral equations the calculus of variations optimal control bifurcation methods and related subjects Discrete Mathematical Problems with Medical Applications Dingzhu Du, Panos M. Pardalos, Jie Wang, 2000 This volume presents selected papers from a three day workshop held during the DIMACS special years on Mathematical Support for Molecular Biology Participants from the world over attended giving the workshop an important international component The study of discrete mathematics and optimization with medical applications is emerging as an important new research area Significant applications have been found in medical research for example in radiosurgical treatment planning virtual endoscopy and more This volume presents a substantive cross section of active research topics ranging from medical imaging to human anatomy modelling from gamma knife treatment planning to radiation therapy and from epileptic seizures to DNA screening This book is an up to date resource reflecting current research directions **Some Mathematical Problems of Tomography and Radiation Treatment** Serguei Lissianoi, 1996 **Mathematics in Industrial Problems** Avner Friedman, 2012-12-06 This is the third volume in the series Mathematics in Industrial Problems The motivation for these volumes is to foster interaction between Industry and Mathematics at the grass roots that is at the level of specific problems These problems come from Industry they arise from models developed by the industrial scientists in ventures directed at the manufacture of new or improved products At the

same time these problems have the potential for mathematical challenge and novelty To identify such problems I have visited industries and had discussions with their scientists Some of the scientists have subsequently presented their problems in the IMA seminar on Industrial Problems The book is based on questions raised in the seminar and subsequent discussions Each chapter is devoted to one of the talks and is self contained The chapters usually provide references to the mathematical literature and a list of open problems which are of interest to the industrial scientists For some problems partial solution is indicated briefly The last chapter of the book contains a short description of solutions to some of the problems raised in the second volume as well as references to papers in which such solutions have been published

Applied Problems of Radon Transform Semen Grigor'evich Gindikin, 1994 This collection is designed to acquaint readers with advances in Radon transforms carried out in the former Soviet Union The papers focus on mathematical problems related to applications of Radon transforms Some of the problems arose from practical tomography while others are theoretical problems originating in tomography The book should be of use to mathematicians working in integral geometry and mathematical problems of tomography as well as scientists who work on inverse problems and their computer realization

Mathematics and Physics of Emerging Biomedical Imaging National Research Council, Division on Engineering and Physical Sciences, Commission on Physical Sciences, Mathematics, and Applications, Committee on the Mathematics and Physics of Emerging Dynamic Biomedical Imaging, 1996-02-28 This cross disciplinary book documents the key research challenges in the mathematical sciences and physics that could enable the economical development of novel biomedical imaging devices It is hoped that the infusion of new insights from mathematical scientists and physicists will accelerate progress in imaging Incorporating input from dozens of biomedical researchers who described what they perceived as key open problems of imaging that are amenable to attack by mathematical scientists and physicists this book introduces the frontiers of biomedical imaging especially the imaging of dynamic physiological functions to the educated nonspecialist Ten imaging modalities are covered from the well established e g CAT scanning MRI to the

more speculative e.g. electrical and magnetic source imaging. For each modality, mathematics and physics research challenges are identified and a short list of suggested reading offered. Two additional chapters offer visions of the next generation of surgical and interventional techniques and of image processing. A final chapter provides an overview of mathematical issues that cut across the various modalities. The Mathematical Legacy of Leon Ehrenpreis Irene Sabadini, Daniele C.

Struppa, 2012-04-23 Leon Ehrenpreis has been one of the leading mathematicians in the twentieth century. His contributions to the theory of partial differential equations were part of the golden era of PDEs and led him to what is maybe his most important contribution, the Fundamental Principle, which he announced in 1960 and fully demonstrated in 1970. His most recent work on the other hand focused on a novel and far-reaching understanding of the Radon transform and offered new insights in integral geometry. Leon Ehrenpreis died in 2010 and this volume collects writings in his honor by a cadre of distinguished mathematicians, many of which were his collaborators. The Mathematics of Medical Imaging Timothy G.

Feeman, 2010-03-10 In 1979 the Nobel Prize for Medicine and Physiology was awarded jointly to Allan McLeod Cormack and Godfrey Newbold Hounsfield, the two pioneering scientists primarily responsible for the development in the 1960s and early 1970s of computerized axial tomography, popularly known as the CAT or CT scan. In his papers, Cormack, then a Professor at Tufts University in Massachusetts, developed certain mathematical algorithms that he envisioned could be used to create an image from X-ray data. Working completely independently of Cormack and at about the same time, Hounsfield, a research scientist at EMI Central Research Laboratories in the United Kingdom, designed the first operational CT scanner as well as the first commercially available model. See 22 and 23. Since 1980, the number of CT scans performed each year in the United States has risen from about 3 million to over 67 million. What few people who have had CT scans probably realize is that the fundamental problem behind this procedure is essentially mathematical. If we know the values of the integral of a two or three dimensional function along all possible cross sections, then how can we reconstruct the function itself? This particular example of what is known as an inverse problem was studied by Johann Radon, an Austrian mathematician, in the early part of the twentieth century. **The Radon Transform and Medical Imaging** Peter Kuchment, 2014-01-01

This book surveys the main mathematical ideas and techniques behind some well-established imaging modalities such as X-ray CT and emission tomography, as well as a variety of newly developing coupled physics or hybrid techniques including thermoacoustic tomography. The Radon Transform and Medical Imaging emphasizes mathematical techniques and ideas arising across the spectrum of medical imaging modalities and explains important concepts concerning inversion, stability, incomplete data, effects, the role of interior information, and other issues critical to all medical imaging methods. For nonexperts, the author provides appendices that cover background information on notation, Fourier analysis, geometric rays, and linear operators. The vast bibliography with over 825 entries directs readers to a wide array of additional information sources on medical imaging for further study. Computational Radiology and Imaging Christoph B"orgers, Frank

Natterer,2012-12-06 The articles collected in this volume are based on lectures given at the IMA Workshop Computational Radiology and Imaging Therapy and Diagnostics March 17 21 1997 Introductory articles by the editors have been added The focus is on inverse problems involving electromagnetic radiation and particle beams with applications to X ray tomography nuclear medicine near infrared imaging microwave imaging electron microscopy and radiation therapy planning Mathematical and computational tools and models which play important roles in this volume include the X ray transform and other integral transforms the linear Boltzmann equation and for near infrared imaging its diffusion approximation iterative methods for large linear and non linear least squares problems iterative methods for linear feasibility problems and optimization methods The volume is intended not only for mathematical scientists and engineers working on these and related problems but also for non specialists It contains much introductory expository material and a large number of references Many unsolved computational and mathematical problems of substantial practical importance are pointed out

Photoacoustic Imaging and Spectroscopy Lihong Wang, 2017-12-19 Photoacoustics promises to revolutionize medical imaging and may well make as dramatic a contribution to modern medicine as the discovery of the x ray itself once did Combining electromagnetic and ultrasonic waves synergistically photoacoustics can provide deep speckle free imaging with high electromagnetic contrast at high

ultrasonic resolution and without any health risk While photoacoustic imaging is probably the fastest growing biomedical imaging technology this book is the first comprehensive volume in this emerging field covering both the physics and the remarkable noninvasive applications that are changing diagnostic medicine Bringing together the leading pioneers in this field to write about their own work Photoacoustic Imaging and Spectroscopy is the first to provide a full account of the latest research and developing applications in the area of biomedical photoacoustics Photoacoustics can provide functional sensing of physiological parameters such as the oxygen saturation of hemoglobin It can also provide high contrast functional imaging of angiogenesis and hypermetabolism in tumors in vivo Discussing these remarkable noninvasive applications and so much more this reference is essential reading for all researchers in medical imaging and those clinicians working at the cutting edge of modern biotechnology to develop diagnostic techniques that can save many lives and just as importantly do no harm

Time-dependent Problems in Imaging and Parameter Identification Barbara Kaltenbacher, Thomas Schuster, Anne Wald, 2021-02-23 Inverse problems such as imaging or parameter identification deal with the recovery of unknown quantities from indirect observations connected via a model describing the underlying context While traditionally inverse problems are formulated and investigated in a static setting we observe a significant increase of interest in time dependence in a growing number of important applications over the last few years Here time dependence affects a the unknown function to be recovered and or b the observed data and or c the underlying process Challenging applications in the field of imaging and parameter identification are techniques such as photoacoustic tomography elastography dynamic computerized or emission tomography dynamic magnetic resonance imaging super resolution in image sequences and videos health monitoring of elastic structures optical flow problems or magnetic particle imaging to name only a few Such problems demand for innovation concerning their mathematical description and analysis as well as computational approaches for their solution
