Mathematics Of Signal Processing V:

Mathematics in Signal Processing V J. G. McWhirter, I. K. Proudler, Institute of Mathematics and Its Applications, 2002
This is a collection of papers from the IMA conference on Mathematics in Signal Processing. Signal processing is an important industrial area for the application of mathematical concepts; it has recently been fuelled by developments in mobile communications, multimedia systems and digital TV. This collection of papers presents a good coverage of current activity on this subject worldwide and is of interest to those in industry carrying out research into signal processing for communications, sonar, radar, navigation and biomedical applications, and to academic mathematicians identifying new mathematical problems.

Selected Papers in Digital Signal Processing, II IEEE Acoustics, Speech, and Signal Processing Society. Digital Signal Processing Committee, 1976. Digital signal processing I edited by Lawrence R. Rabiner and Charles M. Rader. **Handbook**

of Blind Source Separation Pierre Comon, Christian Jutten, 2010-02-17. Edited by the people who were forerunners in creating the field, together with contributions from 34 leading international experts, this handbook provides the definitive reference on Blind Source Separation, giving a broad and comprehensive description of all the core principles and methods, numerical algorithms and major applications in the fields of telecommunications, biomedical engineering and audio, acoustic and speech processing. Going beyond a machine learning perspective, the book reflects recent results in signal processing and numerical analysis and includes topics such as optimization criteria, mathematical tools, the design of numerical algorithms, convolutive mixtures and time-frequency approaches. This Handbook is an ideal reference for university researchers. R. algebraic identification of underdetermined mixtures, time-frequency methods, Bayesian approaches, blind identification, under nonnegativity, approaches, semi-blind methods for communications. Shows the applications of the methods to key application areas such as telecommunications, biomedical engineering, speech, acoustic, audio and music processing, while also giving a general method for developing applications. **Theory and Computation of Complex Tensors and its**

Applications Maolin Che, Yimin Wei, 2020-04-01. The book provides an introduction of very recent results about the tensors and mainly focuses on the authors' work and perspective. A systematic description about how to extend the numerical linear algebra to the numerical multi-linear algebra is also delivered in this book. The authors design the neural network model for the computation of the rank-one approximation of real tensors, a normalization algorithm to convert some nonnegative tensors to plane stochastic tensors and a probabilistic algorithm for locating a positive diagonal in a nonnegative tensors, adaptive randomized algorithms for computing the approximate tensor decompositions and the QR-type method for computing U-eigenpairs of complex tensors. This book could be used for the Graduate course such as Introduction to Tensor. Researchers may also find it helpful as a reference in tensor research. **Adaptive Processing of Brain Signals** Saeid

Sanei, 2013-05-28. In this book, the field of adaptive learning and processing is extended to arguably one of its most important

contexts which is the understanding and analysis of brain signals No attempt is made to comment on physiological aspects of brain activity instead signal processing methods are developed and used to assist clinical findings Recent developments in detection estimation and separation of diagnostic cues from different modality neuroimaging systems are discussed These include constrained nonlinear signal processing techniques which incorporate sparsity nonstationarity multimodal data and multiway techniques Key features Covers advanced and adaptive signal processing techniques for the processing of electroencephalography EEG and magneto encephalography MEG signals and their correlation to the corresponding functional magnetic resonance imaging fMRI Provides advanced tools for the detection monitoring separation localising and understanding of functional anatomical and physiological abnormalities of the brain Puts a major emphasis on brain dynamics and how this can be evaluated for the assessment of brain activity in various states such as for brain computer interfacing emotions and mental fatigue analysis Focuses on multimodal and multiway adaptive processing of brain signals the new direction of brain signal research

Tensors: Geometry and Applications J. M. Landsberg, 2024-11-07 Tensors are ubiquitous in the sciences The geometry of tensors is both a powerful tool for extracting information from data sets and a beautiful subject in its own right This book has three intended uses a classroom textbook a reference work for researchers in the sciences and an account of classical and modern results in aspects of the theory that will be of interest to researchers in geometry For classroom use there is a modern introduction to multilinear algebra and to the geometry and representation theory needed to study tensors including a large number of exercises For researchers in the sciences there is information on tensors in table format for easy reference and a summary of the state of the art in elementary language This is the first book containing many classical results regarding tensors Particular applications treated in the book include the complexity of matrix multiplication P versus NP signal processing phylogenetics and algebraic statistics For geometers there is material on secant varieties G varieties spaces with finitely many orbits and how these objects arise in applications discussions of numerous open questions in geometry arising in applications and expositions of advanced topics such as the proof of the Alexander Hirschowitz theorem and of the Weyman Kempf method for computing syzygies

Algorithms and Parallel VLSI Architectures III M. Moonen, F. Catthoor, 1995-03-16 A comprehensive overview of the current evolution of research in algorithms architectures and compilation for parallel systems is provided by this publication The contributions focus specifically on domains where embedded systems are required either oriented to application specific or to programmable realisations These are crucial in domains such as audio telecom instrumentation speech robotics medical and automotive processing image and video processing TV multimedia radar and sonar The book will be of particular interest to the academic community because of the detailed descriptions of research results presented In addition many contributions feature the real life applications that are responsible for driving research and the impact of their specific characteristics on the methodologies is assessed The publication will also be of considerable value to senior design engineers and CAD

managers in the industrial arena who wish either to anticipate the evolution of commercially available design tools or to utilize the presented concepts in their own R D programmes
