

Advances in Understanding Neurodegeneration

Neurodegenerative diseases are characterized by progressive dysfunction and death of cells that frequently affect specific neural systems, implying some form of selective vulnerability. Morphologically, neuronal loss is associated with gliosis and, frequently, with misfolding and aggregation of proteins leading to the relentless accumulation of abnormal extracellular and intracellular filamentous deposits in specific cell types (**Fig.1**), mainly neurons and glia, representing the core features/hallmarks of many neurodegenerative disorders. (*Mattson, 2006*).
