Patterning In Vertebrate Development:

Patterning in Vertebrate Development Cheryll Tickle, 2003 One of the most fascinating problems in biology is how a single cell the fertilised egg gives rise to a new individual The fertilised egg divides many times to form an embryo This volume in the Frontiers in Molecular Biology series discusses the methods by which cells in distinct regions of an embryo become different a process known as patterning Patterning is fundamental to establishing the spatial organisation of the developing embryo It ensures that all the parts of the body are generated and that they form in exactly the right places The ultimate in patterning is the formation of precise arrangements of specialised cells and tissues within each organ Understanding the process of patterning during the embryonic development of vertebrates is a particular challenge for developmental biologists because vertebrates have an intricate and complex anatomy and histology The first two chapters of Patterning in Vertebrate Development are introductory explaining to the reader the general principles of vertebrate patterning and early embryology The subsequent chapters address patterning in both nervous system and specific parts of the body Each chapter provides a detailed review of current research in a specific area of interest These include topics such as neural specification antero posterior patterning of the neural tube and molecular basis of vertebrate limb development Throughout the volume examples are drawn from a number of species and particular emphasis is placed on recent discoveries about the molecular basis of patterning in vertebrates The book concludes with a chapter which revisits many of the regions of the embryo previously discussed from an evolutionary perspective Vertebrate Pattern Formation, 2024-05-13 Vertebrate Pattern Formation Volume 159 in the Current Topics in Developmental Biology series highlights advances in the field with this volume presenting interesting chapters on timely topics including Hox genes patterning the vertebrate body Endodermal patterning The use of organoids gastruloids to understand development Cell shape and movements controlling development Neural crest and placodes in vertebrate development Patterning of the neural tube Non canonical Wnt signaling in axial extension The control of transitions along the main body axis Emergence of a left right symmetric body plan in vertebrate embryos Formation of the vascular system Generation of patterns in the paraxial mesoderm and more Provides the authority and expertise of leading contributors from an international board of authors Presents the latest release in the Current Topics in Developmental Biology series Updated release includes the latest information on the Vertebrate Pattern Formation **Developmental Patterning of the Vertebrate Limb** J.Richard Hinchliffe, Juan M. Hurle, Dennis Summerbell, 2012-12-06 Following pioneering work by Harrison on amphibian limbs in the 1920s and by Saunders 1948 on the apical ridge in chick limbs limb development became a classical model system for investigating such fundamental developmental issues as tissue interactions and induction and the control of pattern formation Earlier international conferences at Grenoble 1972 Glasgow 1976 and Storrs Connecticut 1982 reflected the interests and technology of their time Grenoble was concerned with ectoderm mesenchyme interaction but by the time of the

Glasgow meeting the zone of polarizing activity ZPA and its role in control of patterning was the dominant theme Storrs produced the first intimations that the ZPA could be mimicked by retinoic acid RA but the diversity of extracellular molecules particularly in skeletogenesis was the main focus of attention By 1990 the paradigms had again shifted Originally the planners of the ARW saw retinoic acid as a possible morphogen controlling skeletal patterning the variety of extracellular matrix components and their roles and the developmental basis of limb evolution as the leading contemporary topics However as planning proceeded it was clear that the new results emerging from the use of homeobox gene probes first developed to investigate the genetic control of patterning of Drosophila embryos to analyse the localised expression of patterning genes in limb buds would also be an important theme

Patterns and Processes of Vertebrate Evolution

Robert Lynn Carroll, 1997-04-28 The factors that influenced the evolution of the vertebrates are compared with the importance of variation and selection that Darwin emphasised in this broad study of the patterns and forces of evolutionary change

The Neural Crest and Neural Crest Cells in Vertebrate Development and Evolution

Brian K. Hall, 2008-12-28 A presentation of all aspects of neural crest cell origins embryological and evolutionary development and evolution neural crest cell behavior migration and anomalies neurocristopathies and birth defects that arise from defective neural crest development The treatment of development will include discussions of cellular molecular and genetic aspects of the differentiation and morphogenesis of neural crest cells and structures derived from neural crest cells The origins of the neural crest in embryology will be discussed using the recent information on the molecular basis of the specification of the neural crest Also presented are the advances in our understanding of the evolution of jaws from studies on lampreys and of the neural crest from studies on ascidians and amphioxus

Patterning and Cell Type Specification in the Developing

CNS and PNS, 2013-05-06 The genetic molecular and cellular mechanisms of neural development are essential for understanding evolution and disorders of neural systems Recent advances in genetic molecular and cell biological methods have generated a massive increase in new information but there is a paucity of comprehensive and up to date syntheses references and historical perspectives on this important subject The Comprehensive Developmental Neuroscience series is designed to fill this gap offering the most thorough coverage of this field on the market today and addressing all aspects of how the nervous system and its components develop Particular attention is paid to the effects of abnormal development and on new psychiatric neurological treatments being developed based on our increased understanding of developmental mechanisms Each volume in the series consists of review style articles that average 15 20pp and feature numerous illustrations and full references Volume 1 offers 48 high level articles devoted mainly to patterning and cell type specification in the developing central and peripheral nervous systems Series offers 144 articles for 2904 full color pages addressing ways in which the nervous system and its components develop Features leading experts in various subfields as Section Editors and article Authors All articles peer reviewed by Section Editors to ensure accuracy thoroughness and scholarship Volume 1

sections include coverage of mechanisms which control regional specification regulate proliferation of neuronal progenitors and control differentiation and survival of specific neuronal subtypes and controlling development of non neural cells

Towards a Theory of Development Alessandro Minelli,Thomas Pradeu,2014-05-01 Is it possible to explain and predict the development of living things What is development Articulate answers to these seemingly innocuous questions are far from straightforward To date no systematic targeted effort has been made to construct a unifying theory of development This novel work offers a unique exploration of the foundations of ontogeny by asking how the development of living things should be understood It explores the key concepts of developmental biology asks whether general principles of development can be discovered and examines the role of models and theories The two editors one a biologist with long interest in the theoretical aspects of his discipline the other a philosopher of science who has mainly worked on biological systems have assembled a team of leading contributors who are representative of the scientific and philosophical community within which a diversity of thoughts are growing and out of which a theory of development may eventually emerge They analyse a wealth of approaches to concepts models and theories of development such as gene regulatory networks accounts based on systems biology and on physics of soft matter the different articulations of evolution and development symbiont induced development as well as the widely discussed concepts of positional information and morphogenetic field the idea of a programme of development and its critiques and the long standing opposition between preformationist and epigenetic conceptions of development Towards a Theory of Development is primarily aimed at students and researchers in the fields of evo devo developmental biology theoretical biology systems biology biophysics and the philosophy of science

The Embryologic Basis of Craniofacial Structure Michael H. Carstens,2023-09-27 Focusing on the anatomy of the head and neck this book begins at the cellular level of development detailing bone muscle blood supply and innervation along the way It illustrates the origin of each tissue structure to aid in making prognoses beyond the surface deformation offering typical issues seen in the craniofacial region for example Written by a pediatric Craniofacial plastic surgeon and intended for clinicians and residents in the areas of plastic surgery ENT maxillofacial surgery and orthodontistry this book is the first of its kind to focus so intently on evolution of the craniofacial structure It is neatly broken up into two distinct sections The first section is meant for readers to gain a fundamental understanding of the development of craniofacial structures from embryo onward relying on the concepts of the Neuromeric Theory The chapters in the first section of the book trace the development of the typical patient The second section offers clinical examples of how the Neuromeric Theory can be used to repair or reconstruct various regions of the head and neck

Craniofacial clefts including cleft lip and palate ocular hypotelorism anencephaly craniosynostosis and more are detailed Understanding the formation of the tissue structures involved in any given genetic deformation or anomaly enables the clinician to provide a more satisfying outcome for the patient both structurally and aesthetically New and current therapeutic options are explored and supported through original illustrations and photographs to aid in determining the best treatment for each individual patient Embryological Principles of Craniofacial Structure bridges the gap between introductory books on the basic anatomy of the head and neck and the detailed understanding required for corrective surgery of craniofacial defects
