Prostate Cancer Methods and Protocols Pamela J. Russell,Paul Jackson,Elizabeth A. Kingsley,2008-02-01

Prostate cancer is the second leading cancer in men in Western society A major concern and an area of intensive research involves understanding why certain prostate cancers remain localized or indolent whereas others become aggressive and metastasize The differences between these cancer types have profound implications for patients and physicians Indolent disease which grows very slowly generally does not cause any problems to the patient whereas aggressive disease requires immediate treatment the earlier the better At present there are no markers that discriminate between these two entities thus causing a dilemma for the management of patients who have recently been diagnosed The aim of Prostate Cancer Methods and Protocols is to explore cutting edge molecular methods that may have the potential to reveal markers of disease for use in more accurate diagnoses of prostate cancer and consequently to lead to new treatment strategies This book provides a comprehensive collection of both in vitro and in vivo step by step protocols currently used by leaders in prostate cancer research advice on approaches that can be used in the study of prostate cancer as well as reviews covering areas less amenable to laboratory research such as environmental factors in prostate cancer to provide the reader with an overview of the prostate cancer research field as it currently stands

Gianinazzi-Pearson, 2012-12-06 Plants interact with a large number of microorganisms which have a major impact on their growth either by establishing mutually beneficial symbiotic relationships or by developing as pathogens at the expense of the plant with deleterious effects These microorganisms differ greatly not only in their nature viruses phytoplasmas bacteria fungi nematodes but also in the way they contact penetrate and invade their host Histology and cytology have brought an essential contribution to our knowledge of these phenomena They have told us for instance how specialized structures of the pathogen are often involved in the adhesion and penetration into the plant how the interface between both organisms is finely arranged at the cellular level or what structural alterations affect the infected tissues They have thus set the stage for the investigations of the underlying molecular mechanisms could be undertaken Such investigations have been remarkably successful in the recent years expanding considerably our understanding of plant microorganism interactions in terms of biochemical changes rapid modifications of enzymatic activities coordinated gene activation signal reception and transduction Biochemistry molecular biology and cellular physiology have taken precedence in the phytopathologist's set of methods *Quantitative Cyto- and Histoprognosis in Breast Cancer* Paul J.
