Supply Chain Planning Hans-Otto Günther, Herbert Meyr, 2009-03-05 In recent years supply chain planning has emerged as one of the most challenging problems in the industry As a consequence the planning focus is shifting from the management of plant specific operations to a holistic view of the various logistics and production stages that is an approach in which suppliers production plants and customers are considered as constituents of an integrated network A major driving force behind this development lies in the globalization of the world economy which has facilitated the co operation between different partners working together in world wide logistics networks Hence considerable cost savings can be gained from optimizing the structure and the operations of complex supply networks linking plants suppliers distribution centres and customers Consequently to improve the performance of the entire logistic chain more sophisticated planning systems and more effective decision support are needed Clearly successful applications of supply chain management have driven the development of advanced planning systems APS which are concerned with supporting decision making activities at the strategic tactical and operational decision level These software packages basically rely on the application of quantitative methods which are used to model the underlying complex decision problems considering the limited availability of resources and the need to react on time to customer orders The core module at the mid term level of APS comprises operational supply chain planning In many industries

production stages are assigned to different plants and distribution centres have been established at geographically dispersed locations
