Evolution as Computation Laura F. Landweber,Erik Winfree,2012-12-06 The study of the genetic basis for evolution has flourished in this century as well as our understanding of the evolvability and programmability of biological systems Genetic algorithms meanwhile grew out of the realization that a computer program could use the biologically inspired processes of mutation recombination and selection to solve hard optimization problems Genetic and evolutionary programming provide further approaches to a wide variety of computational problems A synthesis of these experiences reveals fundamental insights into both the computational nature of biological evolution and processes of importance to computer science Topics include biological models of nucleic acid information processing and genome evolution molecules cells and metabolic circuits that compute logical relationships the origin and evolution of the genetic code and the interface with genetic algorithms and genetic and evolutionary programming

Paradigms of Combinatorial Optimization Vangelis Th. Paschos,2014-08-08 Combinatorial optimization is a multidisciplinary scientific area lying in the interface of three major scientific domains mathematics theoretical computer science and management The three volumes of the Combinatorial Optimization series aim to cover a wide range of topics in this area These topics also deal with fundamental

notions and approaches as with several classical applications of combinatorial optimization Concepts of Combinatorial Optimization is divided into three parts On the complexity of combinatorial optimization problems presenting basics about worst case and randomized complexity Classical solution methods presenting the two most known methods for solving hard combinatorial optimization problems that are Branch and Bound and Dynamic Programming Elements from mathematical programming presenting fundamentals from mathematical programming based methods that are in the heart of Operations Research since the origins of this field *Combinatorics, Words and Symbolic Dynamics* Valérie Berthé, Michel

Rigo, 2016-02-26 Internationally recognised researchers look at developing trends in combinatorics with applications in the study of words and in symbolic dynamics They explain the important concepts providing a clear exposition of some recent results and emphasise the emerging connections between these different fields Topics include combinatorics on words pattern avoidance graph theory tilings and theory of computation multidimensional subshifts discrete dynamical systems ergodic theory numeration systems dynamical arithmetics automata theory and synchronised words analytic combinatorics continued fractions and probabilistic models Each topic is presented in a way that links it to the main themes but then they are also extended to repetitions in words similarity relations cellular automata friezes and Dynkin diagrams The book will appeal to graduate students research mathematicians and computer scientists working in combinatorics theory of computation number theory symbolic dynamics tilings and stringology It will also interest biologists using text algorithms
