The goal of this book is to present basic optimization theory and modern computational algorithms in a concise manner The book is suitable for undergraduate and graduate students in all branches of engineering operations research and management information systems The book should also be useful for practitioners who are interested in learning optimization and using these techniques on their own Most available books in the field tend to be either too theoretical or present computational algorithms in a cookbook style An approach that falls somewhere in between these two extremes is adopted in this book Theory is presented in an informal style to make sense to most undergraduate and graduate students in engineering and business Computational algorithms are also developed in an informal style by appealing to readers intuition rather than mathematical rigor The available computationally oriented books generally present algorithms alone and expect readers to perform computations by hand or implement these algorithms by themselves This obviously is unrealistic for a usual introductory optimization course in which a wide variety of optimization algorithms are discussed There are some books that present programs written in traditional computer languages such as Basic FORTRAN or Pascal These programs help with computations but are of limited value in developing understanding of the algorithms because very little information about the intermediate steps v Preface VI is presented Operations Research in Progress Gustav Feichtinger, P.
