Mathematical Knowledge Its Growth Through Teaching:

Mathematical Knowledge: Its Growth Through Teaching Alan Bishop, Stieg Mellin-Olsen, Joop van Dormolen, 2013-11-27 In the first BACOMET volume different perspectives on issues concerning teacher education in mathematics were presented B Christiansen A G Howson and M Otte Perspectives on Mathematics Education Reidel Dordrecht 1986 Underlying all of them was the fundamental problem area of the relationships between mathematical knowledge and the teaching and learning processes The subsequent project BACOMET 2 whose outcomes are presented in this book continued this work especially by focusing on the genesis of mathematical knowledge in the classroom The book developed over the period 1985-9 through several meetings much discussion and considerable writing and redrafting Our major concern was to try to analyse what we considered to be the most significant aspects of the relationships in order to enable mathematics educators to be better able to handle the kinds of complex issues facing all mathematics educators as we approach the end of the twentieth century With access to mathematics education widening all the time with a multitude of new materials and resources being available each year with complex cultural and social interactions creating a fluctuating context of education with all manner of technology becoming more and more significant and with both informal education through media of different kinds and non formal education courses of training etc growing apace the nature of formal mathematical education is increasingly needing analysis

Why Teach Mathematics? H.W. Heymann, 2013-06-29 Seven years after its publication in Germany this book is now available to English readers In the German speaking countries the publication led to intense controversies on the significance the goals and the future development of mathematics instruction in schools Currently there is much debate in many countries on how to evaluate the findings of such international comparative studies as TIMSS and PISA debate on which consequences should be taken for designing national curricula and on which reforms of mathematics instruction in schools should be initiated I hope that this book might provide substantial suggestions beneficial to resolving these and similar issues for its major concern is twofold first to determine the essential characteristics of general education in schools and secondly on the basis of this to specify the status of mathematics instruction within the framework of general education in schools Due to the fundamental nature of my argument I did not consider it necessary to update the book superficially for the English edition Thus I am presenting the book to the English speaking public in its original form the single exception being that I have omitted the original second chapter since that chapter *Bildung und Allgemeinbildung* seems to be relevant only to those readers especially interested in German educational debates Most of those readers in turn will belong to the German speaking public The omission of this chapter necessitated a few insignificant alterations in the otherwise unchanged introduction and at the beginning of the present second originally third chapter
