

SIGNAL DETECTION THEORY

Signal Detection Theory (SDT) is an informative model for understanding how humans make decisions based on sensory input.

DEFINITION

SDT looks at how humans make a decision based on the strength of a signal and their confidence of what they heard. According to Kelly and Hahn (2019), SDT "is used when psychologists want to measure the way we make decisions under conditions of uncertainty, such as how we would perceive distances in foggy conditions" (p. 159).

OUTCOMES

Signal detection theory (SDT) predicts four possible outcomes that can occur in a detection task, depending on whether the observer responds "yes" or "no" to the presence of a signal. These outcomes are:

- Hit
- Miss
- False alarm
- Correct rejection
