Low-Cost Smart Sensor Interfacing Fransiscus Maria Leonardus van der Goes, 1996-01-01 **Ultra Low Power Capacitive Sensor Interfaces** Wouter Bracke, Robert Puers, Chris Van Hoof, 2007-06-15 The increasing performance of smart microsystems merging sensors signal processing and wireless communication promises to have a pervasive impact during the coming decade These autonomous microsystems and applications in sport evaluation health care environmental monitoring and automotive systems They gather data from the physical world convert them to electrical form compensate for interfering variables or non linearities and either act directly on them or transfer it to other systems Most often these sensor systems are developed for a specific application This approach leads to a high recent design cost A generic front end architecture where only the sensors and the microcontroller software are customized to the selected application would reduce the costs significantly This work presents a new generic architecture for autonomous sensor nodes The modular

design methodology provides a flexible way to build a complete sensor interface out of configurable blocks. The settings of these blocks can be optimized according to the varying needs of the application. Furthermore, the system can easily be expanded with new building blocks. The modular system is illustrated in a Generic Sensor Interface Chip (GSIC) for capacitive sensors. Many configuration settings adapt the interface to a broad range of applications. The GSIC is optimized for ultra-low power consumption. It achieves an ON-state current consumption of 40 nA.

The book outlines the industrial applications for smart sensors, covering direct interface circuits for sensors, capacitive sensors for displacement measurement in the sub-nanometer range, integrated inductive displacement sensors for harsh industrial environments, advanced silicon radiation detectors in the vacuum ultraviolet (VUV) and extreme ultraviolet (EUV) spectral range, among other topics. New sections include discussions on magnetic and temperature sensors and the industrial applications of smart microelectromechanical systems (MEMS). The book is an invaluable reference for academics, materials scientists, and electrical engineers working in the microelectronics, sensors, and micromechanics industry. In addition, engineers looking for industrial sensing, monitoring, and automation solutions will find this a comprehensive source of information. Contains new chapters that address key applications such as magnetic sensors, microreaction chambers, and temperature sensors. Provides in-depth information on a wide array of industrial applications for smart sensors and smart MEMS. Presents the only book to discuss both smart sensors and MEMS for industrial applications.

Direct Sensor-to-Microcontroller Interface Circuits Ferran Reverter, Ramón Pallás-Areny, 2005-11-18

This book describes the design and characterisation of interface circuits for the direct connection of sensors with a time-based output signal to a microcontroller. The topics analysed are: a) the performance of microcontrollers in timing signals; b) the susceptibility of IC quasi-digital sensors to supply voltage changes; and c) the performance of direct modulating sensor-to-microcontroller interfaces based on measuring the charging/discharging time of an RC circuit. The authors analyse the features and limitations of these interface circuits and offer design rules and guidelines for improving their performance. This book interests designers of microcontrollers and IC sensors which can apply the theoretical models developed herein to predict and reduce the effects of power supply interference. It also interests electronic circuit designers which can apply the test circuits, measurement methods, and design rules to their own designs. Finally, the book, being the result of a doctoral thesis, it may inspire other researchers to engage in gaining further insight in some of the topics considered and help them in learning a systematic approach to hypothesis formulation and testing.

Sensor Technology in the Netherlands: State of the Art Albert van den Berg, Piet Bergveld, 2012-12-06

In the rapidly developing information society, there is an ever-growing demand for information-supplying elements or sensors. The

technology to fabricate such sensors has grown in the past few decades from a skilful activity to a mature area of scientific research and technological development. In this process the use of silicon based techniques has appeared to be of crucial importance as it introduced standardized mass fabrication techniques created the possibility of integrated electronics allowed for new transduction principles and enabled the realization of micromechanical structures for sensing or actuation. Such micromechanical structures are particularly well suited to realize complex microsystems that improve the performance of individual sensors. Currently a variety of sensor areas ranging from optical to magnetic and from micromechanical to biochemical sensors has reached a high level of sophistication. In this MESA Monograph the proceedings of the Dutch Sensor Conference an initiative of the Technology Foundation STW held at the University of Twente on March 2-3 1998 are compiled. It comprises all the oral and poster contributions of the conference and gives an excellent overview of the state of the art of Dutch sensor research and development. Apart from Dutch work the contributions of two external invited experts from Switzerland are included.

Analog Circuits and Systems for Voltage-Mode and Current-Mode Sensor Interfacing Applications Andrea De Marcellis, Giuseppe Ferri, 2011-06-29. Analog CMOS Microelectronic Circuits describes novel approaches for analog electronic interfaces design especially for resistive and capacitive sensors showing a wide variation range with the intent to cover a lack of solutions in the literature. After an initial description of sensors and main definitions novel electronic circuits which do not require any initial calibrations are described they show both AC and DC excitation voltage for the employed sensor and use both voltage mode and current mode approaches. The proposed interfaces can be realized both as prototype boards for fast characterization in this sense they can be easily implemented by students and researchers and as integrated circuits using modern low voltage low power design techniques in this case specialist analog microelectronic researchers will find them useful. The primary audience of Analog CMOS Microelectronic Circuits are analog circuit designers sensor companies Ph D students on analog microelectronics undergraduate and postgraduate students in electronic engineering.
