Richardson, 1999-11 The phenomena of superconductivity has enormous industrial potential but the penetration of superconductor based products has thus far been slow An indisputable fact is that there are prizes and profits for the teams that solve the critical problems in understanding and processing these complex materials The continuous processing of superconducting tapes and wires is a necessary stage that will open up the industrial market to the designers of a diverse range of time and energy saving devices particularly in ultra fast computing and lossless power transmission The aim of the research reported herein was to investigate the fabrication of superconducting tapes and films via two different processes namely the established PIT technique and a less well known electrochemical route The PIT research yielded partially textured a characteristic not found in previously reported thallium based PIT tapes and high purity tapes with promising transport properties The main subject of this work is the electrodeposition of superconducting films with particular emphasis on the optimisation of the deposition process as opposed to the optimisation of the post deposition heat treatment This is not a well researched area Therefore the research herein deals with the mechanisms of the deposition process in order to achieve a high standard of reproducibility in producing a variety of superconductor precursor films The heat treatment of the as deposited films was determined and results are presented concerning the characteristics of the resulting superconducting films An attempt was made to fabricate for the first time via electrodeposition Tl Pb 1223 films Superconductivity was successfully observed in both Bismuth and Thallium based films Extensive further work is required but the impact upon society from superconducting devices draws ever nearer **Superconducting Materials** Yassine Slimani, Essia Hannachi, 2022-05-03 This book presents an overview of the science of superconducting materials It covers the fundamentals and theories of superconductivity Subjects of special interest involving mechanisms of high temperature superconductors tunneling transport properties magnetic properties critical states vortex dynamics etc are present in the book It assists as a

High-Temperature Superconductors: Materials, Properties, and Applications Rainer Wesche,2013-11-27 The discovery by J G Bednorz and K A Mtllier in 1986 that the superconducting state can exist in oxides at temperatures above 30 K stimulated research in the field of superconductivity and opened up a new field of research Within a few years a large

number of cuprate superconductors with transition temperatures well above the boiling point of liquid nitrogen have been found. The possibility of using liquid nitrogen as coolant re-stimulated interest in power applications of superconductivity. In this book an overview of the known high T_c superconductors and their physical properties is presented. Aspects related to conductor fabrication and high current applications are emphasised. The material should be suitable for use in graduate level courses on superconductivity. Researchers in the field may profit from the large number of tables and references describing its status at the end of 1997. An introduction to high T_c superconductivity must be based on the fundamental physical principles of normal state electrical conductivity and the well known characteristics of conventional superconductors. In Chapter 2 this background is provided. Crystal structures, anisotropic properties and general trends of the critical temperatures of the cuprate superconductors are described in Chapters 3 and 4. The processing of superconductor powders addressed in Chapter 5 affects considerably the current carrying capacity of high T_c wires. In Chapter 6 several fabrication techniques for superconducting wires are described. In addition the factors limiting the transport critical currents of high T_c wires are discussed.

Advances in Cryogenic Engineering Materials A. F. Clark, 2012-12-06. The Third International Cryogenic Materials Conference (ICMC) was held in Madison, Wisconsin in conjunction with the Cryogenic Engineering Conference (CEC) in August 1979. The University of Wisconsin hosted the two conferences in an excellent manner and deserves special recognition and praise. The synergism produced by conducting the two conferences simultaneously continues to be strong. Materials remain a demanding challenge and in some cases an obstacle to effective application of cryogenic technology. The association of materials specialists and cryogenic engineers every other year centers their attention on the most needed areas of research. The present ICMC Board met during the conference and elected two new members: E. W. Collings, U.S. and D. Evans, England. The board voted to conduct two smaller special topic conferences in 1980. These are: Filamentary Al₅ Superconductors which was held at Brookhaven National Laboratories, Upton, New York in May 1980 and Fundamentals of Nonmetallics and Composites at Low Temperatures held in Geneva, Switzerland in August 1980. The 1981 CEC/ICMC will be held August 10 through 14 in San Diego, California.
