Many Particle Dynamics And Kinetic Equations:

Many-Particle Dynamics and Kinetic Equations C. Cercignani, U.I. Gerasimenko, D.Y. Petrina, 2012-12-06 As our title suggests there are two aspects in the subject of this book The first is the mathematical investigation of the dynamics of infinite systems of interacting particles and the description of the time evolution of their states The second is the rigorous derivation of kinetic equations starting from the results of the aforementioned investigation As is well known statistical mechanics started in the last century with some papers written by Maxwell and Boltzmann Although some of their statements seemed statistically obvious we must prove that they do not contradict what mechanics predicts In some cases in particular for equilibrium states it turns out that mechanics easily provides the required justification However things are not so easy if we take a step forward and consider a gas is not in equilibrium as is e.g. the case for air around a flying vehicle Questions of this kind have been asked since the dawn of the kinetic theory of gases especially when certain results appeared to lead to paradoxical conclusions Today this matter is rather well understood and a rigorous kinetic theory is emerging The importance of these developments stems not only from the need of providing a careful foundation of such a basic physical theory but also to exhibit a prototype of a mathematical construct central to the theory of non equilibrium phenomena of macroscopic size

Modeling and Computational Methods for Kinetic Equations Pierre Degond, Lorenzo Pareschi, Giovanni Russo, 2004-04-07 In recent years kinetic theory has developed in many areas of the physical sciences and engineering and has extended the borders of its traditional fields of application New applications in traffic flow engineering granular media modeling and polymer and phase transition physics have resulted in new numerical algorithms which depart from traditional stochastic Monte Carlo methods This monograph is a self contained presentation of such recently developed aspects of kinetic theory as well as a comprehensive account of the fundamentals of the theory Emphasizing modeling techniques and numerical methods the book provides a unified treatment of kinetic equations not found in more focused theoretical or applied works The book is divided into two parts Part I is devoted to the most fundamental kinetic model the Boltzmann equation of rarefied gas dynamics Additionally widely used numerical methods for the discretization of the Boltzmann equation are reviewed the Monte Carlo method spectral methods and finite difference methods Part II considers specific applications plasma kinetic modeling using the Landau Fokker Planck equations traffic flow modeling granular media modeling quantum kinetic modeling and coagulation fragmentation problems *Modeling and Computational Methods of Kinetic Equations* will be accessible to readers working in different communities where kinetic theory is important graduate students researchers and practitioners in mathematical physics applied mathematics and various branches of engineering The work may be used for self study as a reference text or in graduate level courses in kinetic theory and its applications

Bogdanov,2012-12-06 The subject of this book is the hierarchies of integrable equations connected with the one component and multi component loop groups There are many publications on this subject and it is rather well defined Thus the author would like to explain why he has taken the risk of revisiting the subject The Sato Grassmannian approach and other approaches standard in this context reveal deep mathematical structures in the base of the integrable hierarchies These approaches concentrate mostly on the algebraic

picture and they use a language suitable for applications to quantum field theory Another well known approach the a dressing method developed by S V Manakov and V E Zakharov is oriented mostly to particular systems and exact classes of their solutions There is more emphasis on analytic properties and the technique is connected with standard complex analysis The language of the a dressing method is suitable for applications to integrable nonlinear PDEs integrable nonlinear discrete equations and as recently discovered for the applications of integrable systems to continuous and discrete geometry The primary motivation of the author was to formalize the approach to integrable hierarchies that was developed in the context of the a dressing method preserving the analytic structures characteristic for this method but omitting the peculiarities of the constructive scheme And it was desirable to find a start
