Han,Stanisław Migórski,Mircea Sofonea,2015-03-02 This volume is comprised of articles providing new results on variational and hemivariational inequalities with applications to Contact Mechanics unavailable from other sources The book will be of particular interest to graduate students and young researchers in applied and pure mathematics civil aeronautical and mechanical engineering and can be used as supplementary reading material for advanced specialized courses in mathematical modeling New results on well posedness to stationary and evolutionary inequalities and their rigorous proofs are of particular interest to readers In addition to results on modeling and abstract problems the book contains new results on the numerical methods for variational and hemivariational inequalities

Multi-Valued Variational Inequalities and Inclusions Siegfried Carl,Vy Khoi Le,2021-03-02 This book focuses on a large class of multi valued variational differential

inequalities and inclusions of stationary and evolutionary types with constraints reflected by subdifferentials of convex functionals Its main goal is to provide a systematic unified and relatively self contained exposition of existence comparison and enclosure principles together with other qualitative properties of multi valued variational inequalities and inclusions The problems under consideration are studied in different function spaces such as Sobolev spaces Orlicz Sobolev spaces Sobolev

spaces with variable exponents and Beppo Levi spaces A general and comprehensive sub supersolution method lattice method is developed for both stationary and evolutionary multi valued variational inequalities which preserves the characteristic features of the commonly known sub supersolution method for single valued quasilinear elliptic and parabolic problems This method provides a powerful tool for studying existence and enclosure properties of solutions when the coercivity of the problems under consideration fails It can also be used to investigate qualitative properties such as the

multiplicity and location of solutions or the existence of extremal solutions This is the first in depth treatise on the sub supersolution lattice method for multi valued variational inequalities without any variational structures together with related topics The choice of the included materials and their organization in the book also makes it useful and accessible to a large audience consisting of graduate students and researchers in various areas of Mathematical Analysis and Theoretical Physics

Mathematical Modelling in Solid Mechanics Francesco dell'Isola,Mircea Sofonea,David Steigmann,2017-03-10 This book presents new research results in multidisciplinary fields of mathematical and numerical modelling in mechanics The chapters treat the topics mathematical modelling in solid fluid and contact mechanics nonconvex variational analysis with emphasis to nonlinear solid and structural mechanics numerical modelling of problems with non smooth constitutive laws approximation of variational and hemivariational inequalities numerical analysis of discrete schemes numerical methods and the corresponding algorithms applications to mechanical engineering numerical aspects of non smooth mechanics with emphasis on developing accurate and reliable computational tools mechanics of fibre reinforced materials behaviour of elasto plastic materials accounting for the microstructural defects definition of structural defects based on the differential geometry concepts or on the atomistic basis interaction between phase transformation and dislocations at nano scale energetic arguments bifurcation and post buckling analysis of elasto plastic structures engineering optimization and design global optimization and related algorithms The book presents selected papers presented at ETAMM 2016 It includes new and original results written by internationally recognized specialists

Minimax Theorems and Qualitative Properties of the Solutions of Hemivariational Inequalities Dumitru Motreanu,Panagiotis D. Panagiotopoulos,2013-12-01 Boundary value problems which have variational expressions in form of inequalities can be divided into two main classes The class of boundary value problems BVPs leading to variational inequalities and the class of BVPs leading to hemivariational inequalities The first class is related to convex energy functions and has been studied over the last forty years and the second class is related to nonconvex energy functions and has a shorter research life beginning with the works of the second author of the present book in the year 1981 Nevertheless a variety of important results have been produced within the framework of the theory of hemivariational inequalities and their numerical treatment both in Mathematics and in Applied Sciences especially in Engineering It is worth noting that inequality problems i e BVPs leading to variational or to hemivariational inequalities have within a very short time had a remarkable and precipitate development in both Pure and Applied Mathematics as well as in Mechanics and the Engineering Sciences largely because of the possibility of applying and further developing new and efficient mathematical methods in this field taken generally from convex and or nonconvex Nonsmooth Analysis The evolution of these areas of Mathematics has facilitated the solution of many open questions in Applied Sciences generally and also allowed the formulation and the definitive mathematical and numerical study of new classes of interesting problems

Equilibrium Problems and Applications Gábor Kassay,Vicențiu Rădulescu,2018-10-09 Equilibrium Problems and Applications develops a unified variational approach to deal with single valued set valued and quasi equilibrium problems The authors promote original results in relationship with classical contributions to the field of equilibrium problems The content evolved in the general setting of topological vector spaces and it lies at the interplay between pure and applied nonlinear analysis mathematical economics and mathematical physics This abstract approach is

based on tools from various fields including set valued analysis variational and hemivariational inequalities fixed point theory and optimization Applications include models from mathematical economics Nash equilibrium of non cooperative games and Browder variational inclusions The content is self contained and the book is mainly addressed to researchers in mathematics economics and mathematical physics as well as to graduate students in applied nonlinear analysis A rigorous mathematical analysis of Nash equilibrium type problems which play a central role to describe network traffic models competition games or problems arising in experimental economics Develops generic models relevant to mathematical economics and quantitative modeling of game theory aiding economists to understand vital material without having to wade through complex proofs Reveals a number of surprising interactions among various equilibria topics enabling readers to identify a common and unified approach to analysing problem sets Illustrates the deep features shared by several types of nonlinear problems encouraging readers to develop further this unifying approach from other viewpoints into economic models in turn
