Archaeology

John D. Wilcock
Non-statistical applications of the computer in archaeology

This paper describes an overall computer-aided system for the use of archaeologists employing plain-language keywords to control information retrieval, graphics, and ancillary techniques such as routine reduction of instrument survey readings, objective classification of profiles, and statistical studies of the data.

The majority of papers at this conference have dealt with statistical applications in archaeology, where mathematical techniques are employed in the empirical study of archaeological data as phenomena with observable regularities. Inevitably, the computer has been pressed into the service of mathematicians and statisticians with an interest in archaeology. But it is a fact that the majority of present-day computer applications in business and industry are essentially non-statistical, and many are even non-numerical. It would therefore seem profitable to explore archaeology for non-statistical and non-numerical problems to which computer science may be applied. This seems likely to be an expanding field.

This paper describes applications of the computer in information retrieval, instrument surveys, graphics and the objective classification of artifacts by pattern recognition techniques.

INFORMATION RETRIEVAL

It is becoming very common in these days of the high-speed digital computer for large files of information to be stored on computer media for subsequent analysis. A file of data covering a well-defined topic is called a *data base*, which may then be used as input for an *Information Retrieval* exercise; information relevant to a particular query or set of queries is located and retrieved. The results are usually printed by computer and are then directly available for reference or reproduction by offset-litho printing.

Ideally, records should be made in plain language with as little contraction, stylization, or coding as possible. To have to refer to a code book every time a request is codified or results have to be interpreted is annoying and time-consuming. A request may be formulated from a set of plain-language descriptive terms (called *descriptors*) and it is usual to combine these descriptors by logical operators, for example, logical AND (.), OR (+), NOT (−), ANY n OF ($n/(t+t+t$, and so on)), where n is an integer less than the number of terms t combined by logical operators OR (+).

In order to set up a system using information retrieval, cataloguing terms must be chosen and a thesaurus of words compiled so that the terms and the words embrace all facets of the information to be stored. The terms and the words may be expanded and amended once the system is in operation, but a determined attempt must be made to compile a comprehensive list of

Mathematics And Computers In Archaeology:

   Mathematics and Computers in Archaeology J. E. Doran,F. R. Hodson,1975 This book is for students and practitioners of archaeology It offers an introductory survey of all the applications of mathematical and statistical techniques to their work These applications are increasingly concerned with computerized data classification and quantification and their effect is to reduce the level of uncertainty in the interpretation of the evidence that time and chance have left Any archaeologist wanting to find out what these new methods have to offer has hitherto been forced to search for information in the specialist handbooks conference proceedings and review articles of his own and very often of other disciplines This book brings the information conveniently together so far as it pertains to archaeology and permits an assessment of its relevance and quality Those who have been daunted by the specialist knowledge apparently demanded will now be able to acquire a thorough grasp of principles and practices Only an elementary knowledge of mathematics is presumed throughout Part 1 provides a brief introduction to basic concepts in archaeology and mathematics Part 2 relates the standard archaeological techniques and procedures to mathematics it concentrates on numerical approaches best suited to archaeological practices Part 3 examines various automatic seriation techniques and discusses further work that is coming to play an essential part in the development of archaeology   Mathematics and Computers in Archeology J.
