Nuclear Science Abstracts ,1970 **The Semiotic Sphere** Thomas A. Sebeok,Jean Umiker-Sebeok,2012-12-06 Although semiotics has in one guise or another flourished uninterruptedly since pre Socratic times in the West and important semiotic themes have emerged and developed independently in both the Brahmanic and Buddhist traditions semiotics as an organized undertaking began to bloom only in the 1960s Workshops materialized with a perhaps surprising spontaneity over much of Europe Eastern and Western and in North America Thereafter others quickly surfaced almost everywhere over the literate globe Different places strategically allied themselves with different legacies but all had a common thrust to aim

at a general theory of signs by way of a description of different sign systems their comparative analysis and their classification More or less permanent confederations were forged with the most diverse academic disciplines and amazingly varied frameworks were devised suited to the needs of the times and the sites to carry the work of consolidation forward Bit by bit mutually supportive international networks were put together Today it can truly be asserted that semiotics has become a global enterprise This of course is far from saying that the map is uniform or even that world wide homogeneity is in the least desirable While our conjoint ultimate goal remains steadily in focus the multiplicity of avenues available for its realization is inherent in the advent ure of the search itself

Alexander Martin,Kathrin Klamroth,Jens Lang,Günter Leugering,Antonio Morsi,Martin Oberlack,Manfred Ostrowski,Roland Rosen,2012-06-30 Water supply and drainage systems and mixed water channel systems are networks whose high dynamic is determined and or affected by consumer habits on drinking water on the one hand and by climate conditions in particular rainfall on the other hand According to their size water networks consist of hundreds or thousands of system elements Moreover different types of decisions continuous and discrete have to be taken in the water management The networks have to be optimized in terms of topology and operation by targeting a variety of criteria Criteria may for example be economic social or ecological ones and may compete with each other The development of complex model systems and their use for

deriving optimal decisions in water management is taking place at a rapid pace Simulation and optimization methods originating in Operations Research have been used for several decades usually with very limited direct cooperation with applied mathematics The research presented here aims at bridging this gap thereby opening up space for synergies and innovation It is directly applicable for relevant practical problems and has been carried out in cooperation with utility and dumping companies infrastructure providers and planning offices A close and direct connection to the practice of water management has been established by involving application oriented know how from the field of civil engineering On the mathematical side all necessary disciplines were involved including mixed integer optimization multi objective and facility location optimization numerics for cross linked dynamic transportation systems and optimization as well as control of hybrid systems Most of the presented research has been supported by the joint project Discret continuous optimization of dynamic water systems of the federal ministry of education and research BMBF
