## MATLAB Programming for Engineers

S. Lynch<sup>1</sup>

### Abstract

This chapter of the book presents an introduction to programming with MATLAB® by means of examples from nonlinear dynamics. Section 1 is a brief introduction to MATLAB. Section 2 considers chemical kinetics and autocatalytic reactions. Section 3 introduces the Duffing equation used to model a periodically forced pendulum. Section 4 concentrates on the famous Chua's electronic circuit and Section 5 provides an example from nonlinear optics. Note that the emphasis is on the modelling using MATLAB and there is very little mathematical theory in this chapter.

### 1.1 Introduction

One of the many ventures in the UK National Higher Education Science, Technology, Engineering and Mathematics (HE STEM) programme is the Supporting MATLAB Automated assessment to Reinforce Teaching (SMART) project. Some staff involved include the author (Manchester Metropolitan University and the Open University), Professor Alan Irving (Liverpool University) and Dr Adam Crawford (Loughborough University). Some of the aims include developing students programming skills, engaging students in contextualised real world problems and developing a broader STEM community where academics can share expertise. Some of the objectives include developing an automated assessment system to give individual feedback to large cohorts of students in a short space of time, to disseminate findings through the Institute for Maths and its Applications (IMA) and Royal Academy of Engineers as HE STEM partners and to encourage input and feedback from international colleagues by means of an open educational resource channel. It is hoped that these resources will be freely available within the next few years.

It is assumed that the reader is familiar with either the Windows or *UNIX* platform. This chapter was prepared using MATLAB (R2010b) but most programs should work under earlier and later versions of the package.

A tutorial introduction to MATLAB can be downloaded from the MathWorks Central File Exchange. The commands and programs listed have been chosen to allow the reader to become

*Ism-Matlab Programming for Engineers* Chapman,2007-03-01      **MATLAB® Essentials** William Bober,2017-09-11 All disciplines of science and engineering use numerical methods for complex problem analysis due to the highly mathematical nature of the field Analytical methods alone are unable to solve many complex problems engineering students and professionals confront *Introduction to MATLAB Programming for Engineers and Scientists* examines the basic elements of code writing and describes MATLAB methods for solving common engineering problems and applications across the range of engineering disciplines The text uses a class tested learning approach and accessible two color page design to guide students from basic programming to the skills needed for future coursework and engineering practice      *Essentials of MATLAB Programming* Stephen J. Chapman,2008-11-07 *Stephen Chapman s Essentials of MATLAB Programming* is a successful freshman level text that is useable in a wide range of courses This brief text serves two purposes it teaches how to program using MATLAB as a technical programming language as well as teaching students the basics of computer programming Using top down design methodology the text encourages students to think about the proper design of a program before coding Problem solving skills as well as the ability to locate desired functions within MATLAB are also presented making this text a useful reference tool Important Notice Media content referenced within the product description or the product text may not be available in the ebook version      **Programming for Engineers** Aaron R. Bradley,2011-10-25 To learn to program is to be initiated into an entirely new way of thinking about engineering mathematics and the world in general Computation is integral to all modern engineering disciplines so the better you are at programming the better you will be in your chosen field The author departs radically from the typical presentation by teaching concepts and techniques in a rigorous manner rather than listing how to use libraries and functions He presents pointers in the very first chapter as part of the development of a computational model that facilitates an ab initio presentation of subjects such as function calls call by

reference arrays the stack and the heap The model also allows students to practice the essential skill of memory manipulation throughout the entire course rather than just at the end As a result this textbook goes further than is typical for a one semester course abstract data types and linked lists for example are covered in depth The computational model will also serve students in their adventures with programming beyond the course instead of falling back on rules they can think through the model to decide how a new programming concept fits with what they already know The book is appropriate for undergraduate students of engineering and computer science and graduate students of other disciplines It contains many exercises integrated into the main text and the author has made the source code available online

**Introduction to MATLAB 6 for Engineers** William John Palm (III), 2001 This is a simple concise and useful book explaining MATLAB for freshmen in engineering MATLAB is presently a globally available standard computational tool for engineers and scientists The terminology syntax and the use of the programming language are well defined and the organization of the material makes it easy to locate information and navigate through the textbook This new text emphasizes that students do not need to write loops to solve many problems The MATLAB find command with its relational and logical operators can be used instead of loops in many cases This was mentioned in Palm's previous MATLAB texts but receives more emphasis in this MATLAB 6 edition starting with Chapter 1 and re-emphasized in Chapter 4

**Introduction to Computational Engineering with MATLAB®** Timothy Bower, 2022-09-28 Introduction to Computational Engineering with MATLAB aims to teach readers how to use MATLAB programming to solve numerical engineering problems The book focuses on computational engineering with the objective of helping engineering students improve their numerical problem solving skills The book cuts a middle path between undergraduate texts that simply focus on programming and advanced mathematical texts that skip over foundational concepts feature cryptic mathematical expressions and do not provide sufficient support for novices Although this book covers some advanced topics readers do not need prior computer programming experience or an advanced mathematical background Instead the focus is on learning how to leverage the computer and software environment to do the hard work The problem areas discussed are related to data driven engineering statistics linear algebra and numerical methods Some example problems discussed touch on robotics control systems and machine learning Features Demonstrates through algorithms and code segments how numeric problems are solved with only a few lines of MATLAB code Quickly teaches students the basics and gets them started programming interesting problems as soon as possible No prior computer programming experience or advanced math skills required Suitable for students at undergraduate level who have prior knowledge of college algebra trigonometry and are enrolled in Calculus I MATLAB script files functions and datasets used in examples are available for download from <http://www.routledge.com/9781032221410>
