**Matrix Structural Analysis (Solution Manual)** William McGuire,Richard Hugo Gallagher,1982 **Cross-frame Diaphragm Bracing of Steel Bridge Girders** W. M. Kim Roddis,2008 Steel plate girder bridges make use of traditional cross frame diaphragms to stabilize the compression flange of girders These braces are required during construction especially during deck placement to prevent lateral torsional buckling of bridge girders Girder buckling capacity is a function of cross frame

diaphragm spacing as well as strength and stiffness Recent developments in bridge design may cause the governing girder limit state to shift from one of strength to one of stability These developments include the elimination of in plan bracing composite girders High Performance Steels and phased deck replacements In addition the American Association of State Highway and Transportation Officials AASHTO has changed its code requirement for cross frame diaphragm spacing in the 1998 AASHTO LRFD Bridge Design Specifications The requirement for 25 foot maximum brace spacing has been removed The current requirement is for a rational analysis to determine cross frame diaphragm spacing Explanations of the problems these changes cause in design are discussed A case study is presented of a bridge that suffered construction difficulties during deck placement This investigation found that the cross frame diaphragms were not stiff enough to brace the plate girders during the deck placement Suggestions are given as to an efficient economical design and spacing for cross frame diaphragms on plate girder bridges    **The Structural Engineer** ,2000    **Matrix Structural Analysis** J.
