become key concerns for Chilean policymakers suggesting the need for further fiscal and monetary retrenchment Using an open economy dynamic rational expectations macroeconomic model applied to Chile Schmidt Hebbel and Servén analyze and quantify the macroeconomic impact of fiscal and monetary retrenchment Several features of the model are essential for a realistic assessment of the effects of fiscal and monetary policy shifts in Chile backward indexation of wages consolidation of the central bank and the general government and the coexistence of 1 liquidity constrained consumers and firms with 2 unconstrained agents whose consumption and investment decisions reflect intertemporal optimization with perfect foresight This framework makes it possible to distinguish meaningfully between permanent and transitory policy changes as well as between changes that are or are not anticipated Simulations show that a balanced budget fiscal contraction leads to a modest real depreciation which is sharper in the short term especially if the contraction is temporary At the same time this type of fiscal retrenchment causes a temporary deterioration of the current account An orthodox money based disinflation implemented by halving the growth rate of base money leads to a sharp real appreciation in the near term with steep output and employment costs in the short run but it also causes a transitory improvement in the current account This paper a product of the Macroeconomics and Growth Division Policy Research Department is part of a larger effort in the department to model macroeconomic policy in developing countries **Analysis of Development Problems** P.
