Meeting the world's food security challenge will require a multi-national collaborative effort to integrate the best research from science, engineering, and socioeconomics so that technological advances can bring benefits where they are most needed. The present book covers the effect of major environmental problems on crop production and how to cope with these issues for sustainable agriculture and improvements of crops. The world's population is predicted to hit 9.6 Billion by 2050, up from today's total of nearly 7.3 Billion, and with it, food demand is predicted to increase substantially. The post-war second agricultural revolution in developed countries and the green revolution in developing nations in the mid-1960s converted agricultural practices and elevated crop yields spectacularly, but the outcome is levelling off and will not meet projected demand. Simultaneously, crop production is affected by many other factors, including industrial pollution, overuse of fertilizers, and insecticides, heavy metal, and radiation stresses, etc. It has been noted that many pests are becoming resistant to insecticides. Estimates vary, but around 25% of crops can be lost to pests and diseases. Climate change, associated with

agriculture is also a global issue Agriculture is a significant contributor to greenhouse gases and is estimated to account for 10-12% of total greenhouse gas (GHG) emissions Many of the issues highlighted are global problems and are addressed thoroughly in this work
